[MS-FORMS]:
Forms Service Protocol

Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation ("this documentation") for protocols, file formats, data portability, computer languages, and standards support. Additionally, overview documents cover inter-protocol relationships and interactions.

- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you can make copies of it in order to develop implementations of the technologies that are described in this documentation and can distribute portions of it in your implementations that use these technologies or in your documentation as necessary to properly document the implementation. You can also distribute in your implementation, with or without modification, any schemas, IDLs, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications documentation.

- **No Trade Secrets.** Microsoft does not claim any trade secret rights in this documentation.

- **Patents.** Microsoft has patents that might cover your implementations of the technologies described in the Open Specifications documentation. Neither this notice nor Microsoft's delivery of this documentation grants any licenses under those patents or any other Microsoft patents. However, a given Open Specifications document might be covered by the Microsoft [Open Specifications Promise](https://docs.microsoft.com/en-us/privacypolicy/microsoft-openspec-promise) or the [Microsoft Community Promise](https://docs.microsoft.com/en-us/privacypolicy/microsoft-community-promise). If you would prefer a written license, or if the technologies described in this documentation are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting [iplg@microsoft.com](mailto:iplg@microsoft.com).

- **License Programs.** To see all of the protocols in scope under a specific license program and the associated patents, visit the [Patent Map](https://docs.microsoft.com/en-us/privacypolicy/microsoft-openspec-promise).

- **Trademarks.** The names of companies and products contained in this documentation might be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit [www.microsoft.com/trademarks](https://www.microsoft.com/en-us/trademarks).

- **Fictitious Names.** The example companies, organizations, products, domain names, email addresses, logos, people, places, and events that are depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

**Reservation of Rights.** All other rights are reserved, and this notice does not grant any rights other than as specifically described above, whether by implication, estoppel, or otherwise.

**Tools.** The Open Specifications documentation does not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments, you are free to take advantage of them. Certain Open Specifications documents are intended for use in conjunction with publicly available standards specifications and network programming art and, as such, assume that the reader either is familiar with the aforementioned material or has immediate access to it.

**Support.** For questions and support, please contact [dochelp@microsoft.com](mailto:dochelp@microsoft.com).

1 Introduction

The Forms Service Protocol enables a client to get a list of forms from a protocol server and to get individual forms from that list. A form is an XML structure with elements describing user interface elements that are displayed on a client-side Web page. The definition, display, and use of a form are outside the scope of this document.

Sections 1.5, 1.8, 1.9, 2, and 3 of this specification are normative. All other sections and examples in this specification are informative.

1.1 Glossary

This document uses the following terms:

**absolute URL**: The full Internet address of a page or other World Wide Web resource. The absolute URL includes a protocol, such as "http," a network location, and an optional path and file name — for example, http://www.treyresearch.net/.

**back-end database server**: A server that hosts data, configuration settings, and stored procedures that are associated with one or more applications.

**content database**: A database that is stored on a back-end database server and contains stored procedures, site collections, and the contents of those site collections.

**document**: An object in a content database such as a file, folder, list, or site. Each object is identified by a URI.

**form**: A document with a set of controls into which users can enter information. Controls on a form can be bound to elements in the data source of the form, such as fields and groups. See also bind.

**globally unique identifier (GUID)**: A term used interchangeably with universally unique identifier (UUID) in Microsoft protocol technical documents (TDs). Interchanging the usage of these terms does not imply or require a specific algorithm or mechanism to generate the value. Specifically, the use of this term does not imply or require that the algorithms described in [RFC4122] or [C706] must be used for generating the GUID. See also universally unique identifier (UUID).

**Hypertext Transfer Protocol (HTTP)**: An application-level protocol for distributed, collaborative, hypermedia information systems (text, graphic images, sound, video, and other multimedia files) on the World Wide Web.

**Hypertext Transfer Protocol Secure (HTTPS)**: An extension of HTTP that securely encrypts and decrypts web page requests. In some older protocols, "Hypertext Transfer Protocol over Secure Sockets Layer" is still used (Secure Sockets Layer has been deprecated). For more information, see [SSL3] and [RFC5246].

**item**: A unit of content that can be indexed and searched by a search application.

**item identifier**: An integer that uniquely identifies an item in a SharePoint list.

**list**: A container within a SharePoint site that stores list items. A list has a customizable schema that is composed of one or more fields.

**list identifier**: A GUID that is used to identify a list in a site collection.

**list item**: An individual entry within a SharePoint list. Each list item has a schema that maps to fields in the list that contains the item, depending on the content type of the item.
**page**: A file that consists of HTML and can include references to graphics, scripts, or dynamic content such as Web Parts.

**path component**: Data that identifies a resource within the scope of a scheme and authority in a URI, as described in [RFC3986].

**site**: A group of related pages and data within a SharePoint site collection. The structure and content of a site is based on a site definition. Also referred to as SharePoint site and web site.

**SOAP**: A lightweight protocol for exchanging structured information in a decentralized, distributed environment. **SOAP** uses XML technologies to define an extensible messaging framework, which provides a message construct that can be exchanged over a variety of underlying protocols. The framework has been designed to be independent of any particular programming model and other implementation-specific semantics. SOAP 1.2 supersedes SOAP 1.1. See [SOAP1.2-1/2003].

**SOAP action**: The HTTP request header field used to indicate the intent of the **SOAP** request, using a URI value. See [SOAP1.1] section 6.1.1 for more information.

**SOAP body**: A container for the payload data being delivered by a SOAP message to its recipient. See [SOAP1.2-1/2007] section 5.3 for more information.

**SOAP fault**: A container for error and status information within a SOAP message. See [SOAP1.2-1/2007] section 5.4 for more information.

**store-relative form**: See store-relative URL.

**uncustomized**: A condition of a document whose content is stored in a location other than the content database. If a document is uncustomized, the front-end web server determines the location of the content by using the SetupPath value for the document. Also referred to as ghosted.

**Uniform Resource Locator (URL)**: A string of characters in a standardized format that identifies a document or resource on the World Wide Web. The format is as specified in [RFC1738].

**Web Part**: A reusable component that contains or generates web-based content such as XML, HTML, and scripting code. It has a standard property schema and displays that content in a cohesive unit on a webpage. See also Web Parts Page.

**Web Part zone**: A structured HTML section of a Web Parts Page that contains zero or more Web Parts and can be configured to control the organization and format of those Web Parts.

**Web Services Description Language (WSDL)**: An XML format for describing network services as a set of endpoints that operate on messages that contain either document-oriented or procedure-oriented information. The operations and messages are described abstractly and are bound to a concrete network protocol and message format in order to define an endpoint. Related concrete endpoints are combined into abstract endpoints, which describe a network service. WSDL is extensible, which allows the description of endpoints and their messages regardless of the message formats or network protocols that are used.

**XML namespace**: A collection of names that is used to identify elements, types, and attributes in XML documents identified in a URI reference [RFC3986]. A combination of XML namespace and local name allows XML documents to use elements, types, and attributes that have the same names but come from different sources. For more information, see [XMLNS-2ED].

**XML schema**: A description of a type of XML document that is typically expressed in terms of constraints on the structure and content of documents of that type, in addition to the basic syntax constraints that are imposed by XML itself. An XML schema provides a view of a document type at a relatively high level of abstraction.
MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as defined in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.2 References

Links to a document in the Microsoft Open Specifications library point to the correct section in the most recently published version of the referenced document. However, because individual documents in the library are not updated at the same time, the section numbers in the documents may not match. You can confirm the correct section numbering by checking the Errata.

1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information.

[MS-WSSCAML] Microsoft Corporation, "Collaborative Application Markup Language (CAML) Structure".

1.2.2 Informative References
None.

1.3 Overview
This protocol enables clients to obtain a list of forms contained in a list and to obtain information about individual forms. This protocol follows a straightforward request-response pattern.

1.4 Relationship to Other Protocols
This protocol uses the SOAP message protocol for formatting request and response messages, as described in [SOAP1.1], [SOAP1.2/1] and [SOAP1.2/2]. It transmits those messages by using HTTP, as described in [RFC2616], or Hypertext Transfer Protocol over Secure Sockets Layer (HTTPS), as described in [RFC2818].

The following diagram shows the underlying messaging and transport stack used by the protocol:

```
+----------------------------------+
| Forms Service                    |
+----------------------------------+
| SOAP                            |
| HTTP | HTTPS                      |
+----------------------------------+
| TCP                             |
| IP                               |
+----------------------------------+

This Protocol

Industry Standard
```

Figure 1: This protocol in relation to other protocols

1.5 Prerequisites/Preconditions
This protocol operates against a site that is identified by a URL that is known by protocol clients. The protocol server endpoint is formed by appending "/_vti_bin/Forms.asmx" to the URL of the site, for example, http://www.contoso.com/Repository/_vti_bin/Forms.asmx.

This protocol assumes that authentication has been performed by the underlying protocols.

1.6 Applicability Statement
This protocol enables protocol clients to obtain a list of forms contained in a list and to obtain information about individual forms.

1.7 Versioning and Capability Negotiation
This document covers versioning issues in the following area:

Supported transports: This protocol uses multiple transports with SOAP as described in section 2.1.

1.8 Vendor-Extensible Fields
None.
1.9 Standards Assignments

None.
2 Messages

2.1 Transport

Protocol servers MUST support SOAP over HTTP. Protocol servers SHOULD additionally support SOAP over HTTPS for securing communication with protocol clients, as described in [RFC2818].

Protocol messages MUST be formatted as specified either in [SOAP1.1] section 4, SOAP Envelope, or in [SOAP1.2/1] SOAP Message Construct section 5. Protocol server faults MUST be returned either using HTTP status codes as specified in [RFC2616] Status Code Definitions section 10, or using SOAP faults as specified either in [SOAP1.1] SOAP Fault section 4.4, or in [SOAP1.2/1] SOAP Fault section 5.

2.2 Common Message Syntax

This section contains common definitions that are used by this protocol. The syntax of the definitions uses XML schema, as specified in [XMLSCHEMA1/2] and [XMLSCHEMA2/2], and WSDL, as specified in [WSDL].

2.2.1 Namespaces

This specification defines and references various XML namespaces using the mechanisms specified in [XMLNS]. Although this specification associates a specific XML namespace prefix for each XML namespace that is used, the choice of any particular XML namespace prefix is implementation-specific and is not significant for interoperability.

<td><a href="http://schemas.xmlsoap.org/wsd/">http://schemas.xmlsoap.org/wsd/</a></td>
<td>[WSDL]</td>
</tr>
</tbody>
</table>

2.2.2 Messages

This specification does not define any common WSDL message definitions.

2.2.3 Elements

This specification does not define any common XML schema element definitions.

2.2.4 Complex Types

The following table summarizes the set of common XML schema complex type definitions defined by this specification. XML schema complex type definitions that are specific to a particular operation are described with the operation.
2.2.4.1 SOAPFaultDetails

This complex type defines a **SOAP fault** as follows:

```xml
<s:complexType name="SOAPFaultDetails">
  <s:sequence>
    <s:element name="errorstring" type="s:string"/>
    <s:element name="errorcode" type="s:string" minOccurs="0"/>
  </s:sequence>
</s:complexType>
```

**errorstring**: A human-readable text explaining the application-level fault.

**errorcode**: The hexadecimal representation of a 4-byte result code. The format of the string MUST be 0xAAAAAAAA.<1>

2.2.5 Simple Types

This specification does not define any common **XML schema** simple type definitions.

2.2.6 Attributes

This specification does not define any common **XML schema** attribute definitions.

2.2.7 Groups

This specification does not define any common **XML schema** group definitions.

2.2.8 Attribute Groups

This specification does not define any common **XML schema** attribute group definitions.
3 Protocol Details

The client side of this protocol is a pass-through. That is, no additional timers or other state is required on the client side of this protocol. Calls made by the higher-layer protocol or application are passed directly to the transport, and the results returned by the transport are passed directly back to the higher-layer protocol or application.

Except where specified, protocol clients SHOULD interpret HTTP status codes returned by the protocol server as specified in [RFC2616] Status Code Definitions section 10.

This protocol enables protocol servers to notify protocol clients of application-level faults by using SOAP faults. This protocol enables protocol servers to provide additional details for SOAP faults by including a detail element as specified in either [SOAP1.1] SOAP Fault section 4.4, or [SOAP1.2/1] SOAP Fault section 5.4, that conforms to the XML schema of the SOAPFaultDetails complex type specified in SOAPFaultDetails (section 2.2.4.1). Except where specified, these SOAP faults are not significant for interoperability, and protocol clients can interpret them in an implementation-specific manner.

This protocol enables protocol servers to perform implementation-specific authorization checks and notify protocol clients of authorization faults, using either HTTP status codes or SOAP faults as specified previously in this section.

3.1 Forms Service Protocol Server Details

The following diagram describes the communication between the protocol client and the protocol server.

![Sequence of methods for this protocol](image)

**Figure 2: Sequence of methods for this protocol**

3.1.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

The protocol provides access to form data stored in the back-end database server. The protocol does not create or modify forms, but enables listing and retrieval of form data. The service uses the following types of data.

- **Lists**: A set of information about all lists in a content database. Each entry has a list identifier and is represented by a store-relative form URL.
- **Items**: A set of information about all items in a content database. These entries have item identifiers.
- **Page**: An HTML document that might contain dynamic content such as a Web Part that is interpreted before being displayed in a client application.
3.1.2 Timers
None.

3.1.3 Initialization
None.

3.1.4 Message Processing Events and Sequencing Rules

The following table summarizes the list of WSDL operations as defined by this specification:

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GetForm</td>
<td>This operation is used to get information about a single form.</td>
</tr>
<tr>
<td>GetFormCollection</td>
<td>This operation is used to get information about all forms on a particular list.</td>
</tr>
</tbody>
</table>

3.1.4.1 GetForm

This operation obtains information about a form. The request requires the name of the form and the URL of a list. This operation is defined as follows:

```
<wsdl:operation name="GetForm">
  <wsdl:input message="tns:GetFormSoapIn" />
  <wsdl:output message="tns:GetFormSoapOut" />
</wsdl:operation>
```

The protocol client sends a GetFormSoapIn request message, and the protocol server responds with a GetFormSoapOut response message, as follows:

The protocol server MUST return a SOAP fault if the listName specified in the GetForm element (section 3.1.4.1.2.1) does not exist. The detail error string SHOULD contain an error message to present to the user.

The server MUST return a SOAP fault if the formUrl specified in the GetForm element does not exist.

3.1.4.1.1 Messages

The following table summarizes the set of WSDL message definitions that are specific to this operation:

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GetFormSoapIn</td>
<td>Contains the GetForm operation request with the parameters provided by the protocol client.</td>
</tr>
<tr>
<td>GetFormSoapOut</td>
<td>Contains a GetFormResponse element, as specified in section 3.1.4.1.2.2.</td>
</tr>
</tbody>
</table>
3.1.4.1.1  GetFormSoapIn

This structure contains the GetForm operation request with the parameters provided by the protocol client.

The SOAP action value of the message is defined as follows:

http://schemas.microsoft.com/sharepoint/soap/GetForm

The SOAP body contains a GetForm element, as specified in section 3.1.4.1.2.

3.1.4.1.2  GetFormSoapOut

The SOAP body contains a GetFormResponse element, as specified in section 3.1.4.1.2.2.

3.1.4.1.2 Elements

The following table summarizes the XML schema element definitions that are specific to this operation.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GetForm</td>
<td>Contains the parameters for the GetForm operation.</td>
</tr>
<tr>
<td>GetFormResponse</td>
<td>Contains the return value for the GetForm operation.</td>
</tr>
</tbody>
</table>

3.1.4.1.2.1  GetForm

The GetForm structure contains the parameters for the GetForm operation. This structure is defined as follows:

<s:element name="GetForm">
  <s:complexType>
    <s:sequence>
      <s:element name="listName" type="s:string"/>
      <s:element name="formUrl" type="s:string"/>
    </s:sequence>
  </s:complexType>
</s:element>

listName: A GUID encoded in a string or the title of a list on the site.

formUrl: A URL that identifies the particular form returned. This MUST be an absolute URL that SHOULD end with the hierarchical path component of the URL with no input component.

3.1.4.1.2.2  GetFormResponse

This structure contains the return value for the GetForm operation. This structure is defined as follows:

<s:element name="GetFormResponse">
  <s:complexType>
    <s:sequence>
      <s:element name="GetFormResult" minOccurs="0"/>
    </s:sequence>
  </s:complexType>
</s:element>
GetFormResult: A structure that holds the data returned from the WSDL operation.

Form: A complex type that holds the information of a form.

Type: A string indicating the general type of form as specified in [MS-WSSCAML] section 2.3.1.5.

Name: The unique identifier of the form.

Url: The server relative URL of the page hosting the form.
**Default:** A Boolean value as specified in [MS-WSSCAML] section 2.1.12. Specifies whether the form is the default form of the list. It is an optional attribute that appears only if previously set in the XML schema of the form definition.

**FormId:** A string that contains a non-negative integer. This SHOULD<2> be unique for each form in the back-end database server. It is an optional attribute that appears only if previously set in the XML schema of the form definition.

**Template:** The form template name. It is an optional attribute that appears only if previously set in the XML schema of the form definition.

**WebPartZoneID:** Identifier of the Web Part zone that contains the form. It is an optional attribute that appears only if previously set in the XML schema of the form definition.

**SetupPath:** Source path to the uncustimized document of the form. It is an optional attribute that appears only if previously set in the XML schema of the form definition.

### 3.1.4.1.3 Complex Types

None.

### 3.1.4.1.4 Simple Types

None.

### 3.1.4.1.5 Attributes

None.

### 3.1.4.1.6 Groups

None.

### 3.1.4.1.7 Attribute Groups

None.

### 3.1.4.2 GetFormCollection

This operation lists all of the forms on a list. This operation is defined as follows:

```xml
<wsdl:operation name="GetFormCollection">
    <wsdl:input message="tns:GetFormCollectionSoapIn" />
    <wsdl:output message="tns:GetFormCollectionSoapOut" />
</wsdl:operation>
```

The protocol client sends a GetFormCollectionSoapIn request message, and the protocol server responds with a GetFormCollectionSoapOut response message, as follows:

If the list specified by the listName in the GetFormCollection element (section 3.1.4.2.1) is not found or the GetFormCollection element is empty, the protocol server MUST respond with a SOAP fault.

### 3.1.4.2.1 Messages

The following table summarizes the set of WSDL message definitions that are specific to this operation.

---

[MS-FORMS] - v20190319
Forms Service Protocol
Copyright © 2019 Microsoft Corporation
Release: March 19, 2019
3.1.4.2.1.1 GetFormCollectionSoapIn

The SOAP action value of the message is defined as follows:

`http://schemas.microsoft.com/sharepoint/soap/GetFormCollection`

The SOAP body contains a `GetFormCollection` element, as specified in section 3.1.4.2.1.

3.1.4.2.1.2 GetFormCollectionSoapOut

The SOAP body contains a `GetFormCollectionResponse` element, as specified in section 3.1.4.2.2.

3.1.4.2.2 Elements

The following table summarizes the XML schema element definitions that are specific to this operation.

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GetFormCollection</td>
<td>Used to pass the parameter for the GetFormCollection operation.</td>
</tr>
<tr>
<td>GetFormCollectionResponse</td>
<td>Holds a list of Form elements, each of which describes a single form.</td>
</tr>
</tbody>
</table>

3.1.4.2.2.1 GetFormCollection

This structure is used to pass the parameter for the GetFormCollection WSDL operation. This operation is defined as follows:

```xml
<s:element name="GetFormCollection">
  <s:complexType>
    <s:sequence>
      <s:element name="listName" type="s:string"/>
    </s:sequence>
  </s:complexType>
</s:element>
```

`listName`: A GUID encoded in a string or the title of a list from which to fetch forms.

3.1.4.2.2.2 GetFormCollectionResponse

This structure holds a list of Form elements, each of which describes a single form. This structure is defined as follows:
<s:element name="GetFormCollectionResponse">
  <s:complexType>
    <s:sequence>
      <s:element name="GetFormCollectionResult">
        <s:complexType>
          <s:sequence>
            <s:element name="Forms">
              <s:complexType>
                <s:sequence>
                  <s:element name="Form" minOccurs="0" maxOccurs="unbounded">
                    <s:complexType>
                      <s:attribute name="Type" use="required">
                        <s:simpleType>
                          <s:restriction base="s:string">
                            <s:enumeration value="DisplayForm"/>
                            <s:enumeration value="EditForm"/>
                            <s:enumeration value="NewForm"/>
                            <s:enumeration value="NewFormDialog"/>
                            <s:enumeration value="SolutionForm"/>
                            <s:enumeration value=""/>
                          </s:restriction>
                        </s:simpleType>
                      </s:attribute>
                      <s:attribute name="Url" type="s:string" use="required"/>
                    </s:complexType>
                  </s:element>
                </s:sequence>
              </s:complexType>
            </s:element>
          </s:sequence>
        </s:complexType>
      </s:element>
    </s:sequence>
  </s:complexType>
</s:element>

GetFormCollectionResult: This structure holds the data returned from the WSDL operation.

Forms: A list of complex types Form. It holds the information of a list of form.

Form: A complex type that holds the information of a form.

Type: A string with the form type. It MUST be the same type as the one defined in GetFormResponse (section 3.1.4.1.2.2).

Url: The server relative URL<3> of the page hosting the form.

3.1.4.2.3 Complex Types

None.

3.1.4.2.4 Simple Types
None.

3.1.4.2.5 Attributes
None.

3.1.4.2.6 Groups
None.

3.1.4.2.7 Attribute Groups
None.

3.1.5 Timer Events
None.

3.1.6 Other Local Events
None.
4 Protocol Examples

This section provides some example client-server exchanges. White space has been added to improve readability.

4.1 GetFormCollection

A client-server exchange for the **GetFormCollection** operation resembles the following example.

Client to server:

```xml
<?xml version="1.0" encoding="utf-8"?>
<soap:Envelope
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:xsd="http://www.w3.org/2001/XMLSchema"
    xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/">
    <soap:Body>
        <GetFormCollection
            xmlns="http://schemas.microsoft.com/sharepoint/soap/">
            <listName>Custom Test</listName>
        </GetFormCollection>
    </soap:Body>
</soap:Envelope>
```

Server response:

```xml
<?xml version="1.0" encoding="utf-8"?>
<soap:Envelope
    xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:xsd="http://www.w3.org/2001/XMLSchema">
    <soap:Body>
        <GetFormCollectionResponse
            xmlns="http://schemas.microsoft.com/sharepoint/soap/">
            <GetFormCollectionResult>
                <Forms>
                    <Form Url="Lists/Custom Test/DispForm.aspx"
                          Type="DisplayForm" />
                    <Form Url="Lists/Custom Test/EditForm.aspx"
                          Type="EditForm" />
                    <Form Url="Lists/Custom Test/NewForm.aspx"
                          Type="NewForm" />
                </Forms>
            </GetFormCollectionResult>
        </GetFormCollectionResponse>
    </soap:Body>
</soap:Envelope>
```

4.2 GetForm

A client-server exchange for the **GetForm** operation resembles the following example.

Client request:

```xml
<?xml version="1.0" encoding="utf-8"?>
<soap:Envelope
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xmlns:xsd="http://www.w3.org/2001/XMLSchema"
    xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/">
    <soap:Body>
        <GetFormCollection
            xmlns="http://schemas.microsoft.com/sharepoint/soap/">
            <listName>Custom Test</listName>
        </GetFormCollection>
    </soap:Body>
</soap:Envelope>
```
<soap:Envelope
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:xsd="http://www.w3.org/2001/XMLSchema"
  xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/">
  <soap:Body>
    <GetForm xmlns="http://schemas.microsoft.com/sharepoint/soap/">
      <listName>{FDA9C196-8655-45C4-91BB-2B42682CD278}</listName>
      <formUrl>http://office/Lists/Custom Test/NewForm.aspx</formUrl>
    </GetForm>
  </soap:Body>
</soap:Envelope>

Server response:

<?xml version="1.0" encoding="utf-8"?>
<soap:Envelope
  xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:xsd="http://www.w3.org/2001/XMLSchema">
  <soap:Body>
    <GetFormResponse xmlns="http://schemas.microsoft.com/sharepoint/soap/">
      <GetFormResult>
        <Form Type="NewForm"
          Url="NewForm.aspx"
          SetupPath="pages\form.aspx"
          WebPartZoneID="Main" />
      </GetFormResult>
    </GetFormResponse>
  </soap:Body>
</soap:Envelope>
5 Security

5.1 Security Considerations for Implementers
None.

5.2 Index of Security Parameters
None.
Appendix A: Full WSDL

For ease of implementation, the full WSDL and schema are provided in this appendix.

```xml
<?xml version="1.0" encoding="utf-8"?>
<wsdl:definitions xmlns:soap="http://schemas.xmlsoap.org/wsd1 soap/"
xmlns:tns="http://schemas.microsoft.com/sharepoint/soap/

        <soap12:body use="literal"/>
      </wsdl:output>
    </wsdl:operation>
  </wsdl:binding>
</wsdl:definitions>
7 Appendix B: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include updates to those products.

- Microsoft Office 2003
- The 2007 Microsoft Office system
- Microsoft Office 2010 suites
- Microsoft Office 2013
- Windows SharePoint Services 2.0
- Windows SharePoint Services 3.0
- Microsoft SharePoint Foundation 2010
- Microsoft SharePoint Foundation 2013
- Windows 8.1 Update
- Microsoft Office 2016
- Windows 10 operating system
- Microsoft SharePoint Server 2016
- Microsoft Office 2019
- Microsoft SharePoint Server 2019

Exceptions, if any, are noted in this section. If an update version, service pack or Knowledge Base (KB) number appears with a product name, the behavior changed in that update. The new behavior also applies to subsequent updates unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms "SHOULD" or "SHOULD NOT" implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term "MAY" implies that the product does not follow the prescription.

<1> Section 2.2.4.1: Windows SharePoint Services 3.0 does not return a result code.

<2> Section 3.1.4.1.2.2: Windows SharePoint Services 3.0 returns the FormId of the default form that is the same type as the form specified by using Form Url in the SOAP request.

<3> Section 3.1.4.2.2.2: Windows SharePoint Services 3.0 returns the URLs relative to the list from which the forms are fetched.
8 Change Tracking

No table of changes is available. The document is either new or has had no changes since its last release.
