Outlook Post Office Protocol Version 3 (POP3) Standards Support

This document provides a statement of standards support. It is intended for use in conjunction with the Microsoft technical specifications, publicly available standards specifications, network programming art, and Microsoft distributed systems concepts. It assumes that the reader is either familiar with the aforementioned material or has immediate access to it.

A Standards Support document does not require the use of Microsoft programming tools or programming environments in order to implement the standard. Developers who have access to Microsoft programming tools and environments are free to take advantage of them.

Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation ("this documentation") for protocols, file formats, data portability, computer languages, and standards support. Additionally, overview documents cover inter-protocol relationships and interactions.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you can make copies of it in order to develop implementations of the technologies that are described in this documentation and can distribute portions of it in your implementations that use these technologies or in your documentation as necessary to properly document the implementation. You can also distribute in your implementation, with or without modification, any schemas, IDLs, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications documentation.
- **No Trade Secrets.** Microsoft does not claim any trade secret rights in this documentation.
- **Patents.** Microsoft has patents that might cover your implementations of the technologies described in the Open Specifications documentation. Neither this notice nor Microsoft's delivery of this documentation grants any licenses under those patents or any other Microsoft patents. However, a given Open Specifications document might be covered by the Microsoft Open Specifications Promise or the Microsoft Community Promise. If you would prefer a written license, or if the technologies described in this documentation are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting iplg@microsoft.com.
- **License Programs.** To see all of the protocols in scope under a specific license program and the associated patents, visit the Patent Map.
- **Trademarks.** The names of companies and products contained in this documentation might be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit www.microsoft.com/trademarks.
- **Fictitious Names.** The example companies, organizations, products, domain names, email addresses, logos, people, places, and events that are depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

Reservation of Rights. All other rights are reserved, and this notice does not grant any rights other than as specifically described above, whether by implication, estoppel, or otherwise.

Tools. The Open Specifications documentation does not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments, you are free to take advantage of them. Certain Open Specifications documents are intended for use in conjunction with publicly available standards.
specifications and network programming art and, as such, assume that the reader either is familiar with the aforementioned material or has immediate access to it.

Support. For questions and support, please contact dochelp@microsoft.com.

This document describes the choices made when implementing the Post Office Protocol Version 3 (POP3) Standard. It identifies ambiguities and implementer choices and indicates the approach taken in the implementation. The details of the implementation itself are described in the specifications for the relevant protocols or data structures, not in this document.

1 Introduction

This document specifies the level of support provided by Outlook for the Post Office Protocol - Version 3 (POP3), as specified in [RFC1939]. Outlook uses the POP3 protocol to retrieve messages from the server.

1.1 Glossary

This document uses the following terms:

Post Office Protocol - Version 3 (POP3): A protocol that is used for accessing email from mail servers, as described in [RFC1939].

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as defined in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.2 References

Links to a document in the Microsoft Open Specifications library point to the correct section in the most recently published version of the referenced document. However, because individual documents in the library are not updated at the same time, the section numbers in the documents may not match. You can confirm the correct section numbering by checking the Errata.

1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information.

1.2.2 Informative References

None.

1.3 Microsoft Implementations

- Microsoft Office Outlook 2007
- Microsoft Outlook 2010
- Microsoft Outlook 2013
- Microsoft Outlook 2016
- Microsoft Outlook 2019
1.4 Standards Support Requirements

The conformance requirements for [RFC1939] are that all required portions of the specifications are implemented according to the specification, and any optional portions that are implemented are implemented according to the specification.

The following table lists the sections of [RFC1939] that are considered normative and the sections that are considered informative.

<table>
<thead>
<tr>
<th>Section(s)</th>
<th>Normative/Informative</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 – 2</td>
<td>Informative</td>
</tr>
<tr>
<td>3 – 7</td>
<td>Normative</td>
</tr>
<tr>
<td>8 – 11</td>
<td>Informative</td>
</tr>
<tr>
<td>12</td>
<td>Normative</td>
</tr>
<tr>
<td>13 – 15</td>
<td>Informative</td>
</tr>
</tbody>
</table>

1.5 Notation

The following notations are used in this specification.

<table>
<thead>
<tr>
<th>Notation</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>C####</td>
<td>This identifies a clarification of ambiguity in the target specification. This includes imprecise statements, omitted information, discrepancies, and errata. This does not include data formatting clarifications.</td>
</tr>
<tr>
<td>V#####</td>
<td>This identifies an intended point of variability in the target specification such as the use of MAY, SHOULD, or RECOMMENDED. This does not include extensibility points.</td>
</tr>
<tr>
<td>E#####</td>
<td>Because the use of extensibility points (such as optional implementation-specific data) may impair interoperability, this profile identifies such points in the target specification.</td>
</tr>
</tbody>
</table>
2 Standards Support Statements

2.1 Normative Variations

There are no normative variations from [RFC1939].

2.2 Clarifications

The following sub-sections identify clarifications relative to [RFC1939].

Additional Outlook POP3 extensions to [RFC1939] are as specified in [MS-OXPOP3].

2.2.1 [RFC1939] Section 3, Basic Operation

C0001:

The specification states: "When a client host wishes to make use of the service, it establishes a TCP connection with the server host."

Microsoft Office Outlook 2007, Microsoft Outlook 2010, Microsoft Outlook 2013, Microsoft Outlook 2016, Microsoft Outlook 2019

When a client host wishes to make use of the service, it MUST establish a TCP connection with the server host.

C0002:

The specification states: "When the connection is established, the POP3 server sends a greeting."

When the connection is established, the POP3 server MUST send a greeting. If Outlook does not receive a greeting, then the POP synchronization will stop responding.

C0003:

The specification states: "All commands are terminated by a CRLF pair. Keywords and arguments consist of printable ASCII characters."

All commands sent by the client to the server MUST be terminated by a CRLF pair and MUST consist only of printable ASCII characters.

C0004:

The specification states: "Keywords and arguments are each separated by a single SPACE character."

When the client sends a command, keywords and arguments MUST be separated by a single SPACE character. When the client receives a response to a command, the client MUST accept multiple SPACE characters and tab characters between keywords and arguments.

C0005:

The specification states: "All responses are terminated by a CRLF pair."

The server response MUST be terminated by a CRLF pair. If Outlook does not receive the terminating CRLF pair, then the POP synchronization stops responding.

V0001:

The specification states: "Servers MUST send the '+OK' and '-ERR' in upper case."

Outlook treats any response that begins with "+" as positive and any other response as negative. The casing of the status indicators has no effect on how Outlook interprets the responses.

C0006:

The specification states: "In these cases, which are clearly indicated below, after sending the first line of the response and a CRLF, any additional lines are sent, each terminated by a CRLF pair. When all lines of the response have been sent, a final line is sent, consisting of a termination octet (decimal code 046, '.') and a CRLF pair."

Each line MUST be terminated with a CRLF. The final line MUST consist of a termination octet and a CRLF pair. If Outlook does not receive the terminating CRLF, then the POP synchronization stops responding.

V0002:

The specification states: "When examining a multi-line response, the client checks to see if the line begins with the termination octet. If so and if octets other than CRLF follow, the first octet of the line (the termination octet) is stripped away. If so and if CRLF immediately follows the termination character, then the response from the POP server is ended and the line containing '.CRLF' is not considered part of the multi-line response."

The client MUST examine the octets after the termination octet and, if anything other than the CRLF pair follows the termination octet, then the client MUST remove the termination octet to process the rest of the line normally. Outlook only looks for the termination octet at the beginning of the line and does not check past the termination octet for the LIST, UIDL, and CAPA commands. The CAPA command is specified in [RFC2449] section 5.

C0007:

The specification states: "Once the TCP connection has been opened and the POP3 server has sent the greeting, the session enters the AUTHORIZATION state. In this state, the client must identify itself to the POP3 server."

The client MUST identify itself to the server after it has received the greeting.

2.2.2 [RFC1939] Section 4, The AUTHORIZATION State

C0008:

The specification states: "The client must now identify and authenticate itself to the POP3 server."

The client MUST now identify and authenticate itself to the POP3 server.
C0009:

The specification states: "While there is no single authentication mechanism that is required of all POP3 servers, a POP3 server must of course support at least one authentication mechanism."

While there is no single authentication mechanism that is required of all POP3 servers, a POP3 server MUST support at least one authentication mechanism.

Without an authentication method that Outlook supports, Outlook is not able to authenticate to the server.

C0010:

The specification states: "If the server does not close the connection, the client may either issue a new authentication command and start again, or the client may issue the QUIT command."

If the server does not close the connection, the client can either issue a new authentication command and start again, or the client can issue the QUIT command.

"May" is not interpreted as "MAY" by Outlook. The server has the option to perform either action, and Outlook does not suggest or require either.

C0011:

The specification states: "The first message in the maildrop is assigned a message-number of '1', the second is assigned '2', and so on, so that the nth message in a maildrop is assigned a message-number of 'n'."

The server MUST assign the first message in the maildrop a message-number of "1", and so on, so that the nth message in a maildrop is assigned a message-number of "n".

2.2.3 [RFC1939] Section 4, QUIT Command

C0012:

The specification states that the QUIT command has no arguments.

The client MUST NOT send arguments with the QUIT command.

2.2.4 [RFC1939] Section 5, The TRANSACTION State

C0013:

The specification states: "The client may now issue any of the following POP3 commands repeatedly."

"May" is not interpreted as "MAY" by Outlook.

The client can now issue any of the following POP3 commands repeatedly.

C0014:
The specification states: "After each command, the POP3 server issues a response."
The server MUST issue a response for each command. If Outlook does not receive a response, then the POP synchronization stops responding.

2.2.5  [RFC1939] Section 5, STAT Command
C0015:
The specification states that the STAT command has no arguments.
The client MUST NOT send arguments with the STAT command.
C0016:
The specification states: "Restrictions: may only be given in the TRANSACTION state."
The client SHOULD only send the STAT command when in the TRANSACTION state.
C0017:
The specification states: "In order to simplify parsing, all POP3 servers are required to use a certain format for drop listings. The positive response consists of ‘+OK’ followed by a single space, the number of messages in the maildrop, a single space, and the size of the maildrop in octets. This memo makes no requirement on what follows the maildrop size."
The positive response from the server MUST consist of "+OK" followed by one or more space or tab characters, the number of messages in the maildrop followed by one or more space or tab characters, and the size of the maildrop in octets. The server MAY follow this with additional information.

2.2.6  [RFC1939] Section 5, LIST Command
V0003:
The specification states: "Arguments: a message-number (optional), which, if present, may NOT refer to a message marked as deleted."
The client MAY send the message-number argument with the LIST command.
Outlook never sends an argument to the LIST command.
C0018:
The specification states: "Restrictions: may only be given in the TRANSACTION state."
The client SHOULD only send the LIST command when in the TRANSACTION state.
C0019:
The specification states: "Discussion: If an argument was given and the POP3 server issues a positive response with a line containing information for that message. This line is called a "scan listing" for that message."

If the LIST command includes an argument and the server returns success, then the server MUST issue a positive response line (a "scan listing"). Outlook does not send an argument with the LIST command, so no server response is issued.

C0020:

The specification states: "If no argument was given and the POP3 server issues a positive response, then the response given is multi-line. After the initial '+OK' for each message in the maildrop, the POP3 server responds with a line containing information for that message."

If the LIST command does not include an argument and the server issues a positive response, then the response given MUST be multi-line. The initial line MUST be the positive response "+OK". Then the server MUST send a "scan list" for each message in the maildrop on its own line.

C0021:

The specification states: "All POP3 servers are required to use a certain format for scan listings. A scan listing consists of the message-number of the message, followed by a single space and the exact size of the message in octets."

The "scan listing" MUST consist of the number of the message followed by one or more space or tab characters and then the exact size of the message in octets. The server MAY follow this with additional information.

2.2.7 [RFC1939] Section 5, RETR Command

V0004:

The specification states: "Arguments: a message-number (required) which may NOT refer to a message marked as deleted."

The client MUST send the message-number argument with the RETR command.

V0005:

The specification states: "Restrictions: may only be given in the TRANSACTION state."

The client SHOULD only send the RETR command when in the TRANSACTION state.

C0022:

The specification states: "If the POP3 server issues a positive response, then the response given is multi-line."

If the server is returning success, then it MUST issue a multi-line response.
C0023:
The specification states: "After the initial +OK, the POP3 server sends the message corresponding to the given message-number."

If the server is issuing a positive response, then it MUST return the message corresponding to the given message-number in the multi-line response.

2.2.8 [RFC1939] Section 5, DELE Command

C0024:
The specification states: "Arguments: a message-number (required) which may NOT refer to a message marked as deleted."

The client MUST send the message-number argument with the DELE command.

C0025:
The specification states: "Restrictions: may only be given in the TRANSACTION state."

The client SHOULD only send the DELE command when in the TRANSACTION state.

C0026:
The specification states: "Any future reference to the message-number associated with the message in a POP3 command generates an error."

Any future reference to this message-number in a POP3 command MUST generate an error.

2.2.9 [RFC1939] Section 5, NOOP Command

C0027:
The specification states that the NOOP command has no arguments.

The client MUST NOT send arguments with the NOOP command.

C0028:
The specification states: "Restrictions: may only be given in the TRANSACTION state."

The client SHOULD only send the NOOP command when in the TRANSACTION state.

C0029:
The specification states: "Discussion: The POP3 server does nothing, it merely replies with a positive response."
The server MUST return a positive response.

2.2.10 [RFC1939] Section 5, RSET Command

V0006:
The specification states that the RSET command is a required command.

Outlook never sends the RSET command.

2.2.11 [RFC1939] Section 6, QUIT Command

C0030:
The specification states that the QUIT command has no arguments.

The client MUST NOT send arguments with the QUIT command.

2.2.12 [RFC1939] Section 7, Optional POP3 Commands

C0031:
The specification states: "The POP3 commands discussed above must be supported by all minimal implementations of POP3 servers."

The server MUST support all the commands discussed above.

2.2.13 [RFC1939] Section 7, TOP Command

C0032:
The specification states: "Arguments: a message-number (required) which may NOT refer to a message marked as deleted, and a non-negative number of lines (required)."

The client MUST send two arguments. The first argument is the message-number and the second is a non-negative number of lines.

C0033:
The specification states: "Restrictions: may only be given in the TRANSACTION state."

The client SHOULD only send the TOP command when in the TRANSACTION state.

C0034:
The specification states: "If the POP3 server issues a positive response, then the response given is multi-line. After the initial +OK, the POP3 server sends the headers of the message, the blank line separating the headers from the body, and then the number of lines of the indicated message's body."
If the POP3 server issues a positive response, then the response given MUST be multi-line. The first line MUST be the positive response "+OK". The following line MUST be the headers of the message, the blank line separating headers from body, and then the number of lines on the body indicated in the arguments.

### 2.2.14 [RFC1939] Section 7, UIDL Command

**V0007:**

The specification states: "Arguments: a message-number (optional), which, if present, may NOT refer to a message marked as deleted."

**C0035:**

The specification states: "Restrictions: may only be given in the TRANSACTION state."

**C0036:**

The specification states: "Discussion: If an argument was given and the POP3 server issues a positive response with a line containing information for that message."

**C0037:**

The specification states: "If no argument was given and the POP3 server issues a positive response, then the response given is multi-line. After the initial +OK, for each message in the maildrop, the POP3 server responds with a line containing information for that message."

**C0038:**

The specification states: "In order to simplify parsing, all POP3 servers are required to use a certain format for unique-id listings. A unique-id listing consists of the message-number of the message, followed by a single space and the unique-id of the message in octets."
The unique-id listing MUST consist of the number of the message followed by one or more space or tab characters, and then the unique-id of the message in octets. The server MAY follow this with additional information.

C0039:

The specification states: "The unique-id of a message is an arbitrary server-determined string, consisting of one to 70 characters in the range 0x21 to 0x7E, which uniquely identifies a message within a maildrop and which persists across sessions."

The unique-id MUST consist of one to 70 characters in the range 0x2e to 0x7E. The server MUST persist the unique-id that identifies the message across sessions.

C0040:

The specification states: "The server should never reuse a unique-id in a given maildrop, for as long as the entity using the unique-id exists."

The server SHOULD NOT reuse a unique-id for as long as the entity using the unique-id exists. If the server violates this statement, then the action expected on one message could be performed unexpectedly on another message with the same unique-id.

C0041:

The specification states: "Clients should be able to handle a situation where two identical copies of a message in a maildrop have the same unique-id."

The client SHOULD be able to handle two identical copies of a message having the same unique-id.

Outlook does not fully comply with the use of SHOULD in the statement. Using Outlook, an action specified by the user on one message can happen on either message with the identical unique-id during synchronization. But, since the messages are identical, this has little impact. For example, if a user marks one message header for download, then Outlook can download the other message header instead.

2.2.15 [RFC1939] Section 7, USER Command

C0042:

The specification states: "Arguments: a string identifying a mailbox (required), which is of significance ONLY to the server."

The client MUST send one argument.

C0043:

The specification states: "Restrictions: may only be given in the AUTHORIZATION state after the POP3 greeting or after an unsuccessful USER or PASS command."

The client SHOULD only send the USER command when in the AUTHORIZATION state or when a greeting has not been received.
C0044:
The specification states: "To authenticate using the USER and PASS command combination, the client must first issue the USER command."

To authenticate using the USER and PASS command combination, the client MUST issue the USER command first.

C0045:
The specification states: "If the POP3 server responds with a positive status indicator (+OK), then the client may issue either the PASS command to complete the authentication, or the QUIT command to terminate the POP3 session. If the POP3 server responds with a negative status indicator (-ERR) to the USER command, then the client may either issue a new authentication command or may issue the QUIT command."

If the POP3 server responds with a positive status indicator (+OK), then the client SHOULD issue either the PASS command to complete the authentication or the QUIT command to terminate the POP3 session. If the POP3 server responds with a negative status indicator (-ERR) to the USER command, then the client SHOULD either issue a new authentication command or the QUIT command.

2.2.16 [RFC1939] Section 7, PASS Command

C0046:
The specification states: "Arguments: a server/mailbox-specific password (required)."

The client MUST send one argument.

C0047:
The specification states: "Restrictions: may only be given in the AUTHORIZATION state immediately after a successful USER command."

The client SHOULD only send the PASS command in the AUTHORIZATION state and immediately following a successful USER command.

2.2.17 [RFC1939] Section 7, APOP Command

V0008:
The specification states that the APOP command is an optional POP3 command.

Outlook does not support the APOP command.

2.3 Error Handling

There are no additional error handling considerations beyond what are discussed in section 2.2.8.
2.4 Security

None.
3 Change Tracking

This section identifies changes that were made to this document since the last release. Changes are classified as Major, Minor, or None.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements.
- A document revision that captures changes to protocol functionality.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **None** means that no new technical changes were introduced. Minor editorial and formatting changes may have been made, but the relevant technical content is identical to the last released version.

The changes made to this document are listed in the following table. For more information, please contact [dochelp@microsoft.com](mailto:dochelp@microsoft.com).
