Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation ("this documentation") for protocols, file formats, data portability, computer languages, and standards support. Additionally, overview documents cover inter-protocol relationships and interactions.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you can make copies of it in order to develop implementations of the technologies that are described in this documentation and can distribute portions of it in your implementations that use these technologies or in your documentation as necessary to properly document the implementation. You can also distribute in your implementation, with or without modification, any schemas, IDLs, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications documentation.
- **No Trade Secrets.** Microsoft does not claim any trade secret rights in this documentation.
- **Patents.** Microsoft has patents that might cover your implementations of the technologies described in the Open Specifications documentation. Neither this notice nor Microsoft’s delivery of this documentation grants any licenses under those patents or any other Microsoft patents. However, a given Open Specifications document might be covered by the Microsoft [Open Specifications Promise](https://microsoft.com/en-us/o365/openspecifications) or the [Microsoft Community Promise](https://microsoft.com/en-us/o365/microsoftcommunitypromise). If you would prefer a written license, or if the technologies described in this documentation are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting iplg@microsoft.com.
- **License Programs.** To see all of the protocols in scope under a specific license program and the associated patents, visit the [Patent Map](https://microsoft.com/en-us/o365/patentmap).
- **Trademarks.** The names of companies and products contained in this documentation might be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit [www.microsoft.com/trademarks](https://microsoft.com/en-us/o365/trademarks).
- **Fictitious Names.** The example companies, organizations, products, domain names, email addresses, logos, people, places, and events that are depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

**Reservation of Rights.** All other rights are reserved, and this notice does not grant any rights other than as specifically described above, whether by implication, estoppel, or otherwise.

**Tools.** The Open Specifications documentation does not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments, you are free to take advantage of them. Certain Open Specifications documents are intended for use in conjunction with publicly available standards specifications and network programming art and, as such, assume that the reader either is familiar with the aforementioned material or has immediate access to it.

**Support.** For questions and support, please contact dochelp@microsoft.com.

**Preliminary Documentation.** This particular Open Specifications document provides documentation for past and current releases and/or for the pre-release version of this technology. This document provides final documentation for past and current releases and preliminary documentation, as applicable and specifically noted in this document, for the pre-release version. Microsoft will release final documentation in connection with the commercial release of the updated or new version of this
technology. Because this documentation might change between the pre-release version and the final version of this technology, there are risks in relying on this preliminary documentation. To the extent that you incur additional development obligations or any other costs as a result of relying on this preliminary documentation, you do so at your own risk.

1 Introduction

The Excel (.xlsx) Extensions to the Office Open XML SpreadsheetML File Format specifies extensions to the Office Open XML file formats described in [ISO/IEC29500-1:2016]. The extensions are specified using conventions provided by the Office Open XML file formats described in [ISO/IEC29500-3:2015]. The extensions are a collection of structures and parts in a container that specify appropriate content, which can include unstructured or semi-structured tables of numbers, text, or both numbers and text, equations or functions, external data connections, charts, and images. Content in such a container is typically organized in a grid-based layout, and often includes numeric data, structured data, and formulas.

Sections 1.7 and 2 of this specification are normative. All other sections and examples in this specification are informative.

1.1 Glossary

This document uses the following terms:

- **add-in**: Supplemental functionality that is provided by an external application or macro to extend the capabilities of an application.

- **attribute**: A characteristic of some object or entity, typically encoded as a name/value pair.

- **Augmented Backus-Naur Form (ABNF)**: A modified version of Backus-Naur Form (BNF), commonly used by Internet specifications. ABNF notation balances compactness and simplicity with reasonable representational power. ABNF differs from standard BNF in its definitions and uses of naming rules, repetition, alternatives, order-independence, and value ranges. For more information, see [RFC5234].

- **AutoComplete**: A feature that suggests text automatically based on the first few characters that a user types.

- **calculate**: The process by which computations in a workbook are performed.

- **cell**: A box that is formed by the intersection of a row and a column in a worksheet or a table. A cell can contain numbers, strings, and formulas, and various formats can be applied to that data.

- **cell error value**: Any of a number of special values that are returned as a result of an unsuccessful formula calculation.

- **cell reference**: A set of coordinates that a cell occupies on a worksheet. For example, "B3" is the reference of a cell that appears at the intersection of column "B" and row "3".

- **cell value**: The text or numeric content of a cell, or the results of a formula. A cell value does not include a formula expression, cell formatting, or other metadata.

- **character set**: A mapping between the characters of a written language and the values that are used to represent those characters to a computer.

- **color scale**: A specific range of colors that is used to give additional meaning to data by assigning certain values to colors in the spectrum.

- **column**: A single set of data that is displayed vertically in a worksheet or a table.

If access control is configured for the object, its security descriptor contains a discretionary access control list (DACL) with SIDs for the security principals who are allowed or denied access. Applications use this structure to set and query an object’s security status. The security descriptor is used to guard access to an object as well as to control which type of auditing takes place when the object is accessed. The security descriptor format is specified in [MS-DTYP] section 2.4.6; a string representation of security descriptors, called SDDL, is specified in [MS-DTYP] section 2.5.1.

For more information, see [XMLNS-2ED].
XML schema definition (XSD): The World Wide Web Consortium (W3C) standard language that is used in defining XML schemas. Schemas are useful for enforcing structure and constraining the types of data that can be used validly within other XML documents. XML schema definition refers to the fully specified and currently recommended standard for use in authoring XML schemas.

XOR obfuscation: A type of file encryption that helps protect private data by using an exclusive or bitwise operation. This is done by adding a mathematical expression that prevents a simple reverse-engineering process.

1.3 Structure Overview (Synopsis)

1.4 Relationship to Protocols and Other Structures

This file format is a specified set of extensions to Office Open XML SpreadsheetML, specified in [ISO/IEC29500-1:2016]. This specification is dependent on the structures and concepts defined in the following references:

- [MS-OFFCRYPTO] for the persistence format for document signing, information rights management, document encryption, and obfuscation.
- [MS-ODRAWXML] for the persistence format for shapes.

1.5 Applicability Statement

This document specifies a persistence format for extensions to Office Open XML file formats as described in [ISO/IEC29500-1:2016] SpreadsheetML documents. The extensions specified in this document allow for expressing additional content and properties, and are not applicable as a stand-alone file format. Each structure specified in this document is integrated with SpreadsheetML documents as described in [ISO/IEC29500-1:2016] in a particular way, as specified in the section for that structure. All structures are integrated into SpreadsheetML documents in such a way that maintains compatibility with implementations of the Office Open XML file formats as described in [ISO/IEC29500-1:2016].

The extensions specified in this document do not require any other extensions to be used, and do not prohibit any other extensions from being used in the same document.

This persistence format provides interoperability with applications that create or read documents conforming to this structure.

1.6 Versioning and Localization

This document covers versioning issues in the following areas:

- **Structure Versions:** There is only one version of Excel Extensions to the Office Open XML SpreadsheetML File Format.
- **Localization:** The CT_ProtectedRange structure contains fields that specify locale-dependent meaning.

The Security Considerations section also specifies processes and data that are locale-dependent. See each structure and section description for more information.

1.7 Vendor-Extensible Fields

Specified in this document are extensions, using conventions described in [ISO/IEC29500-3:2015], both as structures within parts described in [ISO/IEC29500-1:2016] and as extension parts within the package described in [ISO/IEC29500-2:2012]. Implementations are not required to preserve or remove additional parts when modifying an existing document. See [ISO/IEC29500-3:2015] for more information.
2 Structures

In the following sections, the schema definition might be less restrictive than the processing rules imposed by the application. The XSD in this specification provides a base description of the file format. The text that introduces the XSD specifies additional restrictions that reflect actual Microsoft product behavior. For example, the schema definition might allow for an element to be empty, null, or not present but the behavior of the application as specified restricts the same elements to being non-empty, not null, and present.

2.2.2.1 Cell Formulas

A cell formula is a formula that adheres to the grammar specified in section 2.2.2, with the following restrictions:

- The formula MUST NOT use the bang-reference or bang-name production rules.

All f elements of CT_Cell elements, as specified in [ISO/IEC29500-4:2016] section A.2, and all calculatedColumnFormula and totalsRowFormula elements of CT_TableColumn elements, as specified in [ISO/IEC29500-4:2016] section A.2, are cell formulas.

2.2.2.2 Conditional Formatting Formulas

A conditional formatting formula is a formula that adheres to the grammar specified in section 2.2.2, with the following restrictions:

- The formula MUST NOT use the union-operator, intersection-operator, range-operator, bang-reference, bang-name, array-constant, external-cell-reference, or structure-reference production rules.

2.2.2.3 Data Validation Formulas

A data validation formula is a formula that adheres to the grammar specified in section 2.2.2, with the following restrictions:

- The formula MUST NOT use the union-operator, intersection-operator, range-operator, bang-reference, bang-name, array-constant, sheet-range-reference, or structure-reference production rules.

All formula1 and formula2 elements of CT_DataValidation elements, as specified in [ISO/IEC29500-4:2016] section A.2, are data validation formulas.

2.2.2.4 External Name Formulas

An external name formula is a formula that adheres to the following grammar:

```
external-name-formula = ref-constant / sheet-range-reference / single-sheet-reference
```

When matching the single-sheet or sheet-range rules for an external name formula, the optional workbook-index in those rules MUST NOT be omitted.

All refersTo attributes of CT_ExternalDefinedName elements, as specified in [ISO/IEC29500-4:2016] section A.2, are external name formulas.
2.2.2.5 Name Formulas

A name formula is a **formula** that adheres to the grammar specified in section 2.2.2, with the following differences.

For name formulas, the function-call rule is expanded as follows:

```
function-call =/ (macro-function-call / command-function-call)
```

The formula MUST NOT use the local-cell-reference production rule.

All **formula** and **oldFormula** elements of **CT_RevisionDefinedName** elements, as specified in [ISO/IEC29500-4:2016] section A.2, and all **definedName** elements of **CT_DefinedNames** elements, as specified in [ISO/IEC29500-4:2016] section A.2, are name formulas.

2.2.2.6 Pivot Field Formulas

A pivot field formula is a formula that adheres to the grammar specified in section 2.2.2, with the following differences.

For pivot field formulas, the nospace-expression rule is expanded as follows:

```
nospace-expression =/ pivot-field-name
pivot-field-name = name / apostrophe 1*pivot-field-string-character apostrophe
pivot-field-string-character = apostrophe apostrophe / pivot-field-character
pivot-field-character = character ; MUST NOT be apostrophe
```

A name used in a pivot field formula MUST NOT have any of the following forms:

- **All**
- **Blank**

All **formula** attributes of **CT_CacheField** elements, as specified in [ISO/IEC29500-4:2016] section A.2, are pivot field formulas.

2.2.2.7 Pivot Item Formulas

A pivot item formula is a **formula** that adheres to the grammar specified in section 2.2.2, with the following differences.

For pivot item formulas, the nospace-expression rule is expanded as follows:

```
nospace-expression =/ pivot-items
pivot-items = pivot-item space *(whitespace pivot-item)
pivot-item = pivot-field-name / pivot-field-name "[" pivot-item-value "]"
pivot-item-value = pivot-field-name / [sign] whole-number-part
```

The formula MUST NOT use the ref-infix-operator, array-constant, getpivotdata-params, dcoun-params, dcounta-params, dsum-params, daverage-params, dmin-params, dmax-params, dproduct-
params, dstdev-params, dstdevp-params, dvar-params, dvarp-params, index-params, rand-params, 
now-params, areas-params, rows-params, columns-params, offset-params, cell-params, index-
params, today-params, info-params, or randbetween-params production rules.

A name used in a pivot item formula MUST NOT have any of the following forms:

- All
- Blank

All formula attributes of CT_CalculatedItem elements, as specified in [ISO/IEC29500-4:2016] 
section A.2, are pivot item formulas.

The function syntax ([ISO/IEC29500-1:2016] section 18.17.2.4) is extended by changing the function-name rule to:

```plaintext
function-name =
  prefixed-function-name |
  predefined-function-name |
  user-defined-function-name |
  future-function-list;
```

The future-function-list rule is found in the Formulas grammar.

### 2.2.4 Extensions by Part

This section specifies the elements from Office Open XML file formats as specified in [ISO/IEC29500-1:2016] that are extended by this format. Either the **Ignorable** attribute ([ISO/IEC29500-3:2015] section 10.1.1), **AlternateContent** element ([ISO/IEC29500-3:2015] section 10.2.1), or the **extLst** element ([ISO/IEC29500-1:2016] section 18.2.10) MUST be used to maintain compatibility with Office Open XML file formats implementations as specified in [ISO/IEC29500-1:2016].

### 2.3 Conceptual Overview

This section specifies how higher-level features of the file format are represented by combinations of low-level structures.
2.3.1 PivotTable What-if Analysis

PivotTable what-if analysis enables the editing of summarized values in an OLAP PivotTable ([ISO/IEC29500-1:2016] section 18.10) view, for example, editing summarized values in the PivotTable data area of the PivotTable view.

A CT_PivotEdits element, as specified in section 2.6.37, and its child CT_PivotEdit elements, as specified in section 2.6.38, specify the values in the OLAP PivotTable view that have been modified and the corresponding values in the OLAP PivotTable source data. The CT_PivotUserEdit child element, as specified in section 2.6.41, of the CT_PivotEdit element specifies a value or a formula. The location of the modified value in the OLAP PivotTable view is specified by a PivotTable rule specified by the CT_PivotArea element ([ISO/IEC29500-4:2016] section A.2) in this CT_PivotEdit element. The OLAP tuple that identifies the corresponding value in the OLAP PivotTable source data is specified by the CT_TupleItems element, as specified in section 2.6.43, in this CT_PivotEdit element.

A CT_PivotChanges element, as specified in section 2.6.39, and its child CT_PivotChange elements, as specified in section 2.6.40, specify the values in the OLAP PivotTable view that have been designated for OLAP allocation and the corresponding values in the OLAP PivotTable source data. The order of the CT_PivotChange elements determines the order in which they are designated for OLAP allocation. The CT_PivotChange element specifies a single edited value designated for OLAP allocation. An OLAP allocation value is specified by the CT_PivotEditValue child element, as specified in section 2.6.42, of the CT_PivotChange element. The allocationMethod attribute of the CT_PivotChange element specifies the OLAP allocation method. The OLAP tuple that identifies the location of the edited value in the OLAP PivotTable view and the corresponding value in the OLAP PivotTable source data is specified by the CT_TupleItems child element of the CT_PivotChange element.

For example, when an OLAP PivotTable is refreshed, the values designated for OLAP allocation, specified by the CT_PivotChanges element and its child CT_PivotChange elements, are sent to the OLAP data provider along with the OLAP allocation method indicating how to allocate the updated values. The OLAP data provider updates the values, and those new values are then refreshed and summarized in the data area of the PivotTable view, instead of summarizing the original values from the OLAP PivotTable source data.

If the enableEdit attribute of the CT_PivotTableDefinition element, as specified in section 2.6.32, is "false", CT_PivotEdits and CT_PivotChanges elements MUST NOT exist in this part. PivotTable what-if analysis is enabled if, and only if, the enableEdit attribute of the CT_PivotTableDefinition element is "true" and the PivotTable source data is OLAP.

2.3.2 Slicers

A slicer is a mechanism for filtering data in PivotTable ([ISO/IEC29500-1:2016] section 18.10) views, cube functions, tables ([ISO/IEC29500-1:2016] section 18.5.1.2) and Charts ([ISO/IEC29500-1:2016] section 21.2) based on Non-Worksheet PivotTables. A slicer is based on a field in the slicer source data, and the slicer filters on distinct values in that column. In the case of using OLAP slicer source data, a slicer is based on an OLAP hierarchy.

A slicer has two major parts, a slicer cache and a slicer view. There can be more than one slicer view based on a single slicer cache. When filtering multi-level OLAP hierarchies using slicers, separate slicer views are used for each OLAP level.

2.3.2.1 Slicer Cache

A slicer cache specifies the subset of slicer source data that is cached for display in slicer views, as well as properties related to slicer filtering. A slicer cache is specified by the CT_SlicerCacheDefinition element.
A slicer cache has an associated PivotTable ([ISO/IEC29500-1:2016] section 18.10) PivotCache as specified in section 2.3.2.1.2, or Table ([ISO/IEC29500-1:2016] section 18.5.1.2).

If the slicer source data is an **OLAP data source**, the **sourceName** attribute of the **CT_SlicerCacheDefinition** element specifies the MDX unique name of the associated **OLAP hierarchy**.

If the slicer source data is a non-OLAP data source, the **sourceName** attribute of the **CT_SlicerCacheDefinition** element specifies the associated PivotTable cache **field** of the associated PivotTable **PivotCache**.

If the slicer source data is a table data source, the **sourceName** attribute of the **CT_SlicerCacheDefinition** element specifies the associated **table** field.

If the slicer is used to **filter** PivotTable views, the slicer cache specifies the PivotTable views being filtered as specified in section 2.3.2.1.4.

### 2.3.2.1.1 Slicer Source Data

The **source data** for a **slicer** is specified by the associated PivotTable ([ISO/IEC29500-1:2016] section 18.10) PivotCache as specified in Slicer Cache Relationship to PivotCache, or Table ([ISO/IEC29500-1:2016] section 18.5.1.2) as specified in Slicer Cache Relationship to Table.

### 2.3.2.1.2 Slicer Cache Relationship to PivotCache

A **slicer cache** can be associated with a PivotTable ([ISO/IEC29500-1:2016] section 18.10) PivotCache. The association is specified by the following rules:

- If the **CT_SlicerCacheDefinition** element has a child **CT_OlapSlicerCache** element, then the type of **slicer source data** is **OLAP** and the associated PivotTable ([ISO/IEC29500-1:2016] section 18.10) PivotCache of the slicer cache is specified by the **pivotCacheId** attribute of the **CT_OlapSlicerCache** element. The associated PivotTable ([ISO/IEC29500-1:2016] section 18.10) PivotCache MUST be based on an OLAP connection ([ISO/IEC29500-1:2016] section 18.13.5). The **slicerData** attribute of the **CT_PivotCacheDefinition** element MUST be "true".

- If the **CT_SlicerCacheDefinition** element has a child **CT_TabularSlicerCache** element, the type of slicer source data is non-OLAP and the associated PivotTable ([ISO/IEC29500-1:2016] section 18.10) PivotCache of the slicer cache is specified by the **pivotCacheId** attribute of the **CT_TabularSlicerCache** element. The associated PivotTable ([ISO/IEC29500-1:2016] section 18.10) PivotCache MUST be based on a non-OLAP connection ([ISO/IEC29500-1:2016] section 18.13). The **slicerData** attribute of the **CT_PivotCacheDefinition** element MUST be "false".

Multiple slicer caches can be associated with one PivotTable ([ISO/IEC29500-1:2016] section 18.10) PivotCache.

If a slicer cache is associated, as specified by Slicer Cache Relationship to PivotTable View, with one or more PivotTable ([ISO/IEC29500-1:2016] section 18.10) views, and the slicer source data type is non-OLAP, the slicer cache and each associated PivotTable ([ISO/IEC29500-1:2016] section 18.10) view MUST be associated with the same PivotTable ([ISO/IEC29500-1:2016] section 18.10) PivotCache and the **slicerData** attribute of the **CT_PivotCacheDefinition** element MUST be "false".

If a slicer cache is associated, as specified by Slicer Cache Relationship to PivotTable View, with one or more PivotTable ([ISO/IEC29500-1:2016] section 18.10) views, and the slicer source data type is OLAP, the PivotTable ([ISO/IEC29500-1:2016] section 18.10) PivotCache that is associated with the slicer cache and all PivotTable ([ISO/IEC29500-1:2016] section 18.10) PivotCaches that are associated with the PivotTable ([ISO/IEC29500-1:2016] section 18.10) views MUST be based on the same OLAP connection ([ISO/IEC29500-1:2016] section 18.13.5) and the PivotTable ([ISO/IEC29500-

### 2.3.2.1.3 Slicer Cache Relationship to Table

A *slicer cache* can be associated with a **Table** ([ISO/IEC29500-1:2016] section 18.5.1.2). The association is specified by the following rule:

- If the **CT_SlicerCacheDefinition** element has a child **extLst** element with a child **CT_TableSlicerCache** element, the type of *slicer source data* is table and the associated **Table** ([ISO/IEC29500-1:2016] section 18.5.1.2) of the slicer cache is specified by the **tableId** attribute of the **CT_TableSlicerCache** element.

Multiple slicer caches can be associated with one **Table** ([ISO/IEC29500-1:2016] section 18.5.1.2).

### 2.3.2.1.4 Slicer Cache Relationship to PivotTable View

A slicer, as specified in section 2.3.2.1, can be associated with PivotTable, as specified in [ISO/IEC29500-1:2016] section 18.10, views and Charts ([ISO/IEC29500-1:2016] section 21.2) based on Non-Workbook PivotTables, by the **pivotTables** group element of the **CT_SlicerCacheDefinition** element, as specified in section 2.6.70.

If the associated PivotTable **PivotCache** of a slicer cache, as specified by the Slicer Cache Relationship to PivotCache, is an **OLAP** PivotTable **PivotCache**, the slicer items, as specified in section 2.3.2.1.6, in the slicer cache are used to apply PivotTable OLAP manual filters to the PivotTable **hierarchy** specified by the **sourceName** attribute of the **CT_SlicerCacheDefinition** element in all associated PivotTable views and Charts based on Non-Workbook PivotTables of the slicer cache. The selected slicer items in the slicer cache are converted into selected PivotTable items in the PivotTable OLAP manual filters by the application to apply the filter state of the slicer cache to the associated PivotTable views.

If the associated PivotTable **PivotCache** of a slicer cache, as specified by Slicer Cache Relationship to PivotCache, is a non-OLAP PivotTable **PivotCache**, the PivotTable **PivotCache** of the PivotTable views and the PivotTable **PivotCache** of the slicer cache MUST be the same.

When an OLAP PivotTable view is associated with an OLAP slicer cache, there MUST NOT be more than one slicer cache for each **OLAP hierarchy**. If the slicer cache is associated with at least one Chart based on Non-Workbook PivotTable then the slicer cache MUST be OLAP sourced.

If the associated PivotTable **PivotCache** of a slicer cache, as specified by Slicer Cache Relationship to PivotCache, is a non-OLAP PivotTable **PivotCache**, the slicer items in the slicer cache are used to apply PivotTable non-OLAP manual filters to the PivotTable **field** specified by the **sourceName** attribute of the **CT_SlicerCacheDefinition** element in all associated PivotTable views of the slicer cache. The selected slicer items in the slicer cache are converted into selected PivotTable items in the PivotTable non-OLAP manual filters by the application to apply the filter state of the slicer cache to the associated PivotTable views. See the PivotTable items in [ISO/IEC29500-1:2016] section 18.10 for more details.

### 2.3.2.1.5 Slicer Cache Relationship to Table column

A slicer cache, as specified in section 2.3.2.1, can be associated with **column** in a **Table**, as specified in [ISO/IEC29500-1:2016] section 18.5.1.2. Associated column is specified by the **column** attribute of the **CT_TableSlicerCache** element.
2.3.2.1.6 Slicer Items

Slicer items in a slicer cache represent distinct values in a column of the slicer source data. In the case of slicers based on OLAP slicer source data, the slicer cache is based on an OLAP hierarchy and slicer items represent OLAP members within levels of that OLAP hierarchy.

For slicers associated with PivotTable ([ISO/IEC29500-1:2016] section 18.10) views, each slicer item specifies whether slicer source data exists for that slicer item. For more information, see Slicer Cross Filtering.

Each slicer item also specifies the item selection state, used for filtering, and can specify additional properties. For more information see Non-OLAP Slicer Items and OLAP Slicer Items.

2.3.2.1.6.1 Non-OLAP Slicer Items

The slicer items of a non-OLAP slicer are specified by an ordered sequence of CT_TabularSlicerCacheItem elements. Each slicer item is associated with a PivotTable ([ISO/IEC29500-1:2016] section 18.10) cache item of the associated PivotTable ([ISO/IEC29500-1:2016] section 18.10) cache field in the associated PivotTable ([ISO/IEC29500-1:2016] section 18.10) PivotCache. For more information, see Slicer Cross Filtering.

The order of non-OLAP slicer items in the slicer cache is specified by the sortOrder, crossFilter, and customListSort attributes of the CT_TabularSlicerCache element.

The CT_TabularSlicerCacheItem element also specifies whether the non-OLAP slicer item is selected for filtering and whether data exists in the slicer source data for it. For more information, see Slicer Cross Filtering.

2.3.2.1.6.2 OLAP Slicer Items

A CT_OlapSlicerCache element specifies properties of an OLAP slicer cache, and its descendant elements specify OLAP slicer items.

A CT_OlapSlicerCacheRanges element specifies the cache for an OLAP level in an OLAP slicer cache.

The cache is organized into ranges of cached OLAP slicer items for each OLAP level in the slicer cache. Each range is specified in a CT_OlapSlicerCacheRange element. The startItem attribute of the CT_OlapSlicerCacheRange element specifies the zero-based index of the first OLAP slicer item in this cached range in the ordered collection of all OLAP members that exist in the slicer source data for the associated OLAP level. The collection in the slicer source data is ordered as specified by the sortOrder and crossFilter attributes of the earlier CT_OlapSlicerCacheLevelData element.

Each cached OLAP slicer item in a range is specified by a CT_OlapSlicerCacheItem element.

The OLAP slicer items that are selected for filtering are specified by the CT_OlapSlicerCacheSelections element.
Each individual OLAP slicer item selected for filtering is specified by a `CT_OlapSlicerCacheSelection` element.

### 2.3.2.1.7 Slicer Cross Filtering

Cross filtering is an application behavior that allows one slicer to reflect the results of filtering by another. This behavior exposes whether data exists in the slicer source data for each slicer item when the slicer source data is filtered by the selected slicer items of all associated slicer caches of a PivotTable ([ISO/IEC29500-1:2016] section 18.10) view, as specified by Slicer Cache Relationship to PivotTable View, and all PivotTable ([ISO/IEC29500-1:2016] section 18.10) manual filters in the PivotTable ([ISO/IEC29500-1:2016] section 18.10) view.

If the type of slicer source data is OLAP, the existence of data, after filtering, for a slicer item is specified by the `nd` attribute of the `CT_OlapSlicerCacheItem` element. If the type of slicer source data is non-OLAP, the existence of data for a slicer item is specified by the `nd` attribute of the `CT_TabularSlicerCacheItem` element.

If the type of slicer source data is non-OLAP, the `crossFilter` attribute of the `CT_TabularSlicerCache` element specifies how the non-OLAP slicer items that have no data appear.

If the type of slicer source data is OLAP, the `crossFilter` attribute of the `CT_OlapSlicerCacheLevelData` element specifies how the OLAP slicer items that have no data are displayed for the OLAP level specified by the `uniqueName` attribute of the `CT_OlapSlicerCacheLevelData` element.

### 2.3.2.2 Slicer View

A slicer view specifies the display of a slicer on a worksheet. A slicer view is displayed as a list of slicer items. The slicer view is specified by a `CT_Slicer` element.

Each slicer view is associated with a slicer cache as specified in Slicer View Relationship to Slicer Cache. The filtering state of slicer items displayed in the slicer view is specified by the associated slicer cache.

### 2.3.2.2.1 Slicer View Relationship to Slicer Cache

Each slicer view is associated with a slicer cache. The slicer view is associated with a slicer cache through the name attribute of the `CT_SlicerCacheDefinition` element in the slicer cache that matches the cache attribute of the `CT_Slicer` element that specifies this slicer view.

If a slicer view is associated with an OLAP slicer cache, the slicer view also has an associated OLAP level, specified by the level attribute of the `CT_Slicer` element. In this case, the slicer view displays OLAP slicer items of that OLAP level.

There can be multiple slicer views associated with a single slicer cache. There are two main reasons for this:

- For a user-defined OLAP hierarchy with several OLAP levels—for example, a Geography OLAP hierarchy with Country, State, and City OLAP levels—one slicer view is associated with a single OLAP level, providing a mechanism for filtering different OLAP levels of the OLAP hierarchy.
- Multiple slicer views associated with either the same slicer cache (for a non-OLAP slicer cache) or the same OLAP level (for an OLAP slicer cache) provide a mechanism for displaying the filter state in more than one location in the workbook.
2.3.2.3 Slicers and Cube Functions

Each slicer cache has a defined name associated with it as specified by the name attribute of the CT_SlicerCacheDefinition element.

The value of the CT_DefinedName ([ISO/IEC29500-1:2016] section 18.2.5) element specifying a defined name associated with a slicer cache MUST be #N/A.

If the slicer source data type of a slicer cache is OLAP, cube functions can use the defined name of the slicer cache as a parameter to refer to the selection state of the slicer cache.

2.3.2.4 Slicer Styles

Slicer styles specify the formatting to apply to visual components of slicer views. The style attribute of the CT_Slicer element specifies the slicer style to be applied. A slicer style can be either built-in or user-defined. Built-in slicer styles are specified in the CT_Slicer element. User-defined slicer styles are specified in the CT_SlicerStyles element.

2.3.3 Non-Worksheet PivotTable

Non-Worksheet PivotTables provide a way for Charts ([ISO/IEC29500-1:2016] section 21.2) to be based on PivotTable data without having to show the data in a worksheet. For more information see [MS-ODRAWXML].

A Non-Worksheet PivotTable MUST only be referenced from workbook.

2.3.4 PivotValues

PivotValues specifies the collection of values that are in the PivotTable ([ISO/IEC29500-1:2016] section 18.10) data area. The PivotValues contain a collection of PivotValueCells organized as a two dimensional array corresponding to the PivotTable ([ISO/IEC29500-1:2016] section 18.10) data area.

For a Non-Worksheet PivotTable the PivotValues are specified by the pivotTableData element (section 2.4.63).

For PivotTables on a worksheet the PivotValues are specified by the cells of the worksheet ([ISO/IEC29500-1:2016] section 18.3) cell table in the locations specified by the location element ([ISO/IEC29500-1:2016] section 18.10.1.49) of the PivotTable.
2.3.4.1 PivotValueCell

A PivotValueCell is a point in individual data unit in the data area of a PivotTable ([ISO/IEC29500-1:2016] section 18.10) data area. PivotValueCells contain summarized values for associated PivotTable data items. Every PivotValueCell can have two kinds of information associated with it, the value and the server formatting information.

2.3.4.1.1 Value

The value of a PivotValueCell is specified to be the number, string, error, date associated with the PivotValueCell.

2.3.4.1.2 Server Formatting

The server formatting of a PivotValueCell specifies formatting to be applied to the PivotValueCell.

2.3.5 Timelines

A Timeline is a mechanism for filtering data in PivotTable ([ISO/IEC29500-1:2016] section 18.10) Views, cube functions and Charts ([ISO/IEC29500-1:2016] section 21.2) based on Non-Worksheet PivotTables. In the case of using OLAP Timeline source data, a Timeline is based on a key attribute of an OLAP hierarchy. In the case of using native Timeline source data, a Timeline is based on a data table column.

A Timeline has two major parts: a Timeline cache, and a Timeline view. There can be more than one Timeline view based on a single Timeline cache.

2.3.5.1 Timeline Cache

A Timeline cache specifies the subset of Timeline source data (section 2.3.5.1.1) that is cached for display in Timeline views (section 2.3.5.2), as well as properties related to Timeline filtering (section 2.3.5). A Timeline cache is specified by the CT_TimelineCacheDefinition element (section 2.6.112).

A Timeline cache has an associated PivotTable ([ISO/IEC29500-1:2016] section 18.10) PivotCache as specified in section 2.3.5.1.2.

If the Timeline source data is an OLAP data source, the sourceName attribute of the CT_TimelineCacheDefinition element specifies the key attribute name of the associated OLAP hierarchy. If the Timeline source data is a native data source, the sourceName attribute of the CT_TimelineCacheDefinition element specifies the name of the associated data table column.

If the timeline is used to filter PivotTable views, the Timeline cache specifies the PivotTable views being filtered as specified in Timeline Cache Relationship to PivotTable View (section 2.3.5.1.3).

2.3.5.1.1 Timeline Source Data

The source data for a Timeline is specified by the associated PivotTable ([ISO/IEC29500-1:2016] section 18.10) PivotCache as specified in Timeline Cache Relationship to PivotCache.

2.3.5.1.2 Timeline Cache Relationship to PivotCache

A Timeline cache is associated with a PivotTable ([ISO/IEC29500-1:2016] section 18.10) PivotCache through the pivotCacheId attribute of the CT_TimelineState element. If the Timeline cache has an associated PivotTable PivotCache, the timelineData attribute of the CT_TimelinePivotCacheDefinition element MUST be "true".

Multiple Timeline caches can be associated with one PivotTable PivotCache.
If a Timeline cache is associated, as specified by Timeline Cache Relationship to PivotTable View, with one or more PivotTable views, the PivotTable PivotCache that is associated with the Timeline cache and all PivotTable PivotCaches that are associated with the PivotTable views MUST be based on the same source – an OLAP connection ([ISO/IEC29500-1:2016] section 18.13.5) if the Timeline source data is OLAP and a data table if the Timeline source data is native, and the PivotTable PivotCaches associated with the PivotTable views MUST NOT be associated with any Timeline cache. The timelineData attribute of the CT_TimelinePivotCacheDefinition element for each PivotTable PivotCache associated with the PivotTable views MUST be "false".

2.3.5.1.3 Timeline Cache Relationship to PivotTable View

A Timeline cache can be associated with PivotTable ([ISO/IEC29500-1:2016] section 18.10) views and Charts ([ISO/IEC29500-1:2016] section 21.2) based on Non-Worksheet PivotTables, as specified by the pivotTables group element of the CT_TimelineCacheDefinition element.

The Timeline State of the Timeline cache is used to apply the PivotTable date filter to the PivotTable hierarchy which belongs to the same dimension as the hierarchy associated with the sourceName attribute of the CT_TimelineState element, in all associated PivotTable views and Charts based on Non-Worksheet PivotTables of the Timeline cache. The selected date range in the Timeline cache is converted into selected PivotTable items in the PivotTable date filters by the application to apply the filter state of the Timeline cache to the associated PivotTable views and Charts based on Non-Worksheet PivotTables.

When an OLAP PivotTable view is associated with an OLAP Timeline cache, there MUST NOT be more than one Timeline cache for each OLAP hierarchy. If the Timeline cache has at least one Chart based on Non-Worksheet PivotTable, then the Timeline cache MUST be OLAP sourced. When a native PivotTable view is associated with a native Timeline cache, there MUST NOT be more than one Timeline cache for each data table column.

2.3.5.1.4 Timeline State

Timeline state specifies the information used for display in Timeline view. The Timeline state contains two elements, selection and bounds, of type CT_TimelineRange. The selection element specifies the start and end dates of the selection in the Timeline and is used for filtering data in PivotTable ([ISO/IEC29500-1:2016] section 18.10) views and cube functions. The bounds element specifies the minimum and maximum dates that can be displayed by the Timeline view.

2.3.5.2 Timeline View

A Timeline view specifies the display of a Timeline (section 2.1.8) on a worksheet. The Timeline view is specified by a CT_Timeline element.

Each Timeline view is associated with a Timeline cache as specified in Timeline View Relationship to Timeline Cache. The filtering state of Timeline displayed in the Timeline view is specified by the associated Timeline cache.

2.3.5.2.1 Timeline View Relationship to Timeline Cache

Each Timeline view is associated with a Timeline cache. The Timeline view is associated with Timeline cache through the name attribute of the CT_TimelineCacheDefinition element in the Timeline cache that matches the cache attribute of the CT_Timeline element that specifies this Timeline view.

There can be multiple Timeline views associated with a single Timeline cache. The main reason for this is that multiple Timeline views associated with the same Timeline cache provide a mechanism for displaying the filter state in more than one location in the workbook.
2.3.5.3 Timelines and Cube Functions

Each Timeline cache has a defined name associated with it as specified by the name attribute of the CT_TimelineCacheDefinition element.

The value of the CT_DefinedName ([ISO/IEC29500-1:2016] section 18.2.5) element specifying a defined name associated with a Timeline Cache MUST be #N/A.

If the Timeline source data type of a Timeline cache is OLAP, cube functions can use the defined name of the Timeline cache as a parameter to refer to the selection state of the Timeline cache.

2.3.5.4 Timeline Styles

Timeline styles specify the formatting to apply to visual components of Timeline views. The style attribute of the CT_Timeline element specifies the Timeline style to be applied. A Timeline style can be either built-in or user-defined. Built-in Timeline styles are specified in the CT_Timeline element. User-defined Timeline styles are specified in the CT_TimelineStyles element.

A Timeline style is an extension of a table style ([ISO/IEC29500-1:2016] section 18.8) with additional table style elements specific to the formatting of Timeline views. A user-defined Timeline style is specified by a CT_TimelineStyle element and the table style it references.

A user-defined Timeline style consists of the table style elements from the referenced table style and table style elements specified by a group of CT_TimelineStyleElement elements.

The TimelineStyleElements element of a CT_TimelineStyle element specifies the Timeline-style-specific table style elements of the Timeline style. The name attribute of the CT_TimelineStyle element references the user-defined table style that specifies the Timeline-style-specific table style elements of the Timeline style.

2.3.6 Rich Data

Rich Data is an extensible mechanism to store compound data objects and their properties in a workbook.

2.3.6.1 Rich Values

Each rich value consists of three components, rich value type, key value pairs (KVP), and an optional rich value fallback.

The rich value type is indicated by a CT_RichValueStructure (section 2.6.180). All type names, specified by the t attribute, that begin with an underscore symbol MAY have restrictions on required key value pairs (KVP) and other defined behavior.

The set of key value pairs (KVP) is defined in CT_RichValue (section 2.6.175) and CT_RichValueStructure (section 2.6.180).

The rich value fallback is optionally defined in CT_RichValueFallback (section 2.6.178) and stands in place of the rich value for some features.

While there are restrictions on required key value pairs (KVP) for some rich value types (see the sub-sections of this section for more details), additional key value pairs (KVP) are allowed.

2.3.6.1.1 Error Types

The rich value type for errors is an extension of cell error values. This type represents a modern error in the file, which enables the storage of additional descriptive properties about the error.
This rich value type is identified by having a **CT_RichValueStructure** (section 2.6.180) t attribute of 
"_error" and MUST have the following **key value pair (KVP):**

<table>
<thead>
<tr>
<th>CT_Key &quot;n&quot; attribute</th>
<th>CT_Key &quot;t&quot; attribute</th>
<th>CT_Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;errorType&quot;</td>
<td>Default</td>
<td>Integer, see following sub-sections for more information on specific errors.</td>
</tr>
</tbody>
</table>

### 2.3.6.1.1 Field Error Type

A Field error is a subset of the **rich value type** for errors (section 2.3.6.1.1).

A Field error will show as #FIELD. These errors indicate that a **rich value key** was not found.

This rich value type is identified by having a **CT_RichValueStructure** (section 2.6.180) t attribute of 
"_error" and MUST have the following **key value pairs (KVP):**

<tr>
<th>CT_Key &quot;n&quot; attribute</th>
<th>CT_Key &quot;t&quot; attribute</th>
<th>CT_Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;errorType&quot;</td>
<td>Default</td>
<td>12</td>
</tr>
<tr>
<td>&quot;field&quot;</td>

<td>A string representing the name of the rich value key that could not be found.</td>
</tr>
</tbody>
</table>

### 2.3.6.1.1.2 Unknown Error Type

An Unknown error is a subset of the **rich value type** for errors (section 2.3.6.1.1).

An Unknown error will show as #UNKNOWN. These errors indicate a **rich value** with an unknown rich value type.

This rich value type is identified by having a **CT_RichValueStructure** (section 2.6.180) t attribute of 
"_error" and MUST have the following **key value pair (KVP):**

<th>CT_Key &quot;t&quot; attribute</th>
<th>CT_Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;errorType&quot;</td>
<td>Default</td>
<td>11</td>
</tr>
</tbody>
</table>

### 2.3.6.1.2 Linked Entity and Linked Entity Core Types

Linked Entities represent a **service** connected **rich value type**.

This rich value type is identified by having a **CT_RichValueStructure** (section 2.6.180) t attribute of 
"_linkedentity" and MUST have the following **key value pair (KVP):**

<table>
<thead>
<tr>
<th>CT_Key &quot;n&quot; attribute</th>
<th>CT_Key &quot;t&quot; attribute</th>
<th>CT_Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;%cvi&quot;</td>
<td>rv</td>
<td>Integer that identifies the index to the nested Linked Entity Core Value</td>
</tr>
</tbody>
</table>

All Linked Entities MUST nest a Linked Entity Core Value, which represents the information received from the service.

Linked Entity Core Values are identified by having a **CT_RichValueStructure** (section 2.6.180) t attribute of 
"_linkedentitycore" and MUST have the following **key value pairs (KVP):**

<table>
<thead>
<tr>
<th>CT_Key &quot;n&quot; attribute</th>
<th>CT_Key &quot;t&quot; attribute</th>
<th>CT_Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;%EntityServiceId&quot;</td>
<td>Default</td>
<td>Integer value that is an index to the service domain</td>
</tr>
<tr>
<td>&quot;%EntitySubDomainId&quot;</td>

2.3.6.1.4 ImageUrl Type

The rich value type for an ImageUrl represents information for a URL to an image and associated optional properties.

This rich value type is identified by having a CT_RichValueStructure (section 2.6.180) t attribute of "_imageurl" and MUST have the following key value pair (KVP):
### 2.3.6.1.5 SourceAttribution Type

2.3.6.2 Supporting Property Bags

Each **supporting property bag** is comprised of a set of **key value pairs (KVP)**.

The set of key pairs (KVP) is defined in CT_SupportingPropertyBag (section 2.6.188) for the values and CT_SupportingPropertyBagStructure (section 2.6.195) for the keys.

Supporting property bags can be the data portion of a key value pair (KVP) in a **rich value** to give extra information.

### 2.3.6.3 Special Keys and Key Flags

All **rich value keys** that begin with a non-alphanumeric ASCII character MAY be used internally to define behavior.

The following rich value keys define special behavior.

<table>
<thead>
<tr>
<th>Key name</th>
<th>Key definitions</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;_Attribution&quot;</td>
<td>This key MUST reference a <strong>supporting property bag</strong> that contains information about the source and license attribution.</td>
</tr>
<tr>
<td>&quot;_Display&quot;</td>
<td>This key MUST reference a supporting property bag that contains information that MAY be used to determine how the <strong>rich value</strong> is displayed.</td>
</tr>
<tr>
<td>&quot;_DisplayString&quot;</td>
<td>This key MUST reference a string that MAY be shown in the <strong>cell</strong>.</td>
</tr>
<tr>
<td>&quot;_Flags&quot;</td>
<td>This key MUST reference a supporting property bag that contains <strong>key value pairs (KVP)</strong> containing rich value keys and supporting property bags containing associated <strong>rich value key flags</strong>, which define behavior for the associated rich value key value pair (KVP).</td>
</tr>
<tr>
<td>&quot;_Format&quot;</td>
<td>This key MUST reference a supporting property bag that is a list of identifiers to a CT_RichStyle (section 2.6.170). These are zero-based indices. The index of the key value pair (KVP) in the supporting property bag determines which rich value key the CT_RichStyle is associated with. The first key value pair (KVP) in this supporting property bag will have an index for a CT_RichStyle associated with the first key value pair (KVP) in the rich value that this key is a member of, and so on.</td>
</tr>
<tr>
<td>&quot;_Icon&quot;</td>
<td>This key contains a value that describes the icon that MAY be used in render.</td>
</tr>
<tr>
<td>&quot;_Self&quot;</td>
<td>This key SHOULD NOT exist in the file and will be removed when the file is saved.</td>
</tr>
<tr>
<td>&quot;_SubLabel&quot;</td>
<td>This key MUST reference a supporting property bag that contains key value pairs (KVP) containing rich value keys and supporting property bags containing strings, which define the label that MAY be used to describe the associated rich value key value pair (KVP).</td>
</tr>
<tr>
<td>&quot;_CRID&quot;</td>
<td>This key MUST reference an integer. If this key is a part of a rich value with an unknown <strong>rich value type</strong> (for more information see section 2.3.6.1.1.2), this rich value MUST be preserved.</td>
</tr>
</tbody>
</table>

The following **supporting property bag key** defines special behavior.

<table>
<thead>
<tr>
<th>Key name</th>
<th>Key definitions</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;^Order&quot;</td>
<td>This supporting property bag key is associated with a <strong>supporting property bag array</strong> of strings that SHOULD be comprised of rich value keys in the associated rich value and MAY be used to display the rich value key value pairs (KVP) in a different order.</td>
</tr>
</tbody>
</table>
Rich value keys with defined behavior for all rich value types MAY be listed in **CT_RichValueGlobalType** (section 2.6.179).

Rich value keys with defined behavior for a particular rich value type MAY be listed in **CT_RichValueTypes** (section 2.6.186). The rich value type can be identified by matching the **CT_RichValueType** (section 2.6.182) name attribute to the **CT_RichValueStructure** (section 2.6.180) t attribute.

Both **CT_RichValueGlobalType** and **CT_RichValueTypes** contain **CT_RichValueType** (section 2.6.182), which defines the rich value key flags and their values for each of the reserved rich value keys.

Rich value key flags are associated with key value pairs (KVP) and control particular behavior. Any flags that are absent are treated as having a value of false unless the rich value type has a different default for that rich value key flag. See sections under section 2.3.6.1 for specific type definitions.

Rich value key flags are listed here:

<table>
<thead>
<tr>
<th>Flag name</th>
<th>Flag definitions</th>
</tr>
</thead>
<tbody>
<tr>
<td>ShowInCardView</td>
<td>False indicates that we hide this key value pair (KVP) in the default Card View</td>
</tr>
<tr>
<td>ShowInDotNotation</td>
<td>False indicates that we hide this key value pair (KVP) from formulas and the object model</td>
</tr>
<tr>
<td>ShowInAutoComplete</td>
<td>False indicates that we hide this key value pair (KVP) from AutoComplete, sort, filter, and Find</td>
</tr>
<tr>
<td>ExcludeFromFile</td>
<td>True indicates that we do not write this key value pair (KVP) into the file, it only exists in memory</td>
</tr>
<tr>
<td>ExcludeFromCalcComparison</td>
<td>True indicates that we exclude this key value pair (KVP) when comparing rich values.</td>
</tr>
</tbody>
</table>

**CT_RichValueType** information that is not recognized at runtime will be persisted unless the associated rich value type is removed. **CT_RichValueType** information that contradicts runtime expectations will be ignored and will not be persisted.

### 2.3.6.4 Rich Styles and Properties

Rich values MAY contain particular properties that are used to define the style for a given key value pair (KVP). See **CT_RichFormatProperties** (section 2.6.167) and the "_Format" rich value key (section 2.3.6.3) for more information.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>IsHeroFlag</td>
<td>True indicates that the related key value pair (KVP) MAY be emphasized.</td>
</tr>
<tr>
<td>IsTitleFlag</td>
<td>True indicates that the related key value pair (KVP) is the title for the rich value. This MAY be used for visualizing the rich value.</td>
</tr>
<tr>
<td>IsPrimaryFlag</td>
<td>True indicates that the related key value pair (KVP) MAY be emphasized.</td>
</tr>
<tr>
<td>IsSecondaryFlag</td>
<td>True indicates that the related key value pair (KVP) MAY be emphasized.</td>
</tr>
<tr>
<td>IsFooterFlag</td>
<td>True indicates that the related key value pair (KVP) is the footer for the rich value. This MAY be used for visualizing the rich value.</td>
</tr>
<tr>
<td>IsCellDisplayFlag</td>
<td>True indicates that the related rich value data MAY be shown in the cell.</td>
</tr>

2.4 Global Elements

2.4.1 pivotTableReference

A pivotTableReference element is a CT_PivotTableReference type element, as specified in section 2.6.87, that specifies a PivotTable ([ISO/IEC29500-1:2016] section 18.10) part identifier for the workbook. The PivotTable specified by this element MUST be a Non-Worksheet PivotTable. See section 2.2.4.11 for how this element integrates with the Office Open XML file formats specified in [ISO/IEC29500-1:2016].

The syntax for the **formatCode16** attribute's currency and locale/date system/number system information is `[$<currency string>-<culture info>,<calendar type and numeral system>]`.

The currency string is the string to use as a currency symbol.

The culture info is a culture tag, which can be either an IETF language tag ([RFC5646]) or one of the following private use namespace tags.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-sysdate</td>
<td>System long date format. Cannot be combined with other culture tags.</td>
</tr>
<tr>
<td>x-systime</td>
<td>System time format. Cannot be combined with other culture tags.</td>
</tr>
<tr>
<td>x-euro1</td>
<td>Trailing generic Euro currency. Cannot be combined with other culture tags.</td>
</tr>
<tr>
<td>x-euro2</td>
<td>Leading generic Euro currency. Cannot be combined with other culture tags.</td>
</tr>
<tr>
<td>x-genlower</td>
<td>Use genitive lowercase form for any full month names in the format (Russian language only). Append to IETF language tag, for example, &quot;ru-RU-x-genlower&quot;.</td>
</tr>
<tr>
<td>x-genupper</td>
<td>Use genitive uppercase form for any full month names in the format (Russian language only). Append to IETF language tag, for example, &quot;ru-RU-x-genupper&quot;.</td>
</tr>
<tr>
<td>x-nomlower</td>
<td>Use nominative lowercase form for any full month names in the format (Russian language only). Append to IETF language tag, for example, &quot;ru-RU-x-nomlower&quot;.</td>
</tr>
<tr>
<td>x-xbt1</td>
<td>Trailing Bitcoin currency. Cannot be combined with other culture tags.</td>
</tr>
<tr>
<td>x-xbt2</td>
<td>Leading Bitcoin currency. Cannot be combined with other culture tags.</td>
</tr>
</tbody>
</table>

The optional calendar type and numeral system data is a 16-bit number in hexadecimal form that is placed after a culture tag, separated by a comma. The contents are defined by the **formatCode** attribute ([ISO/IEC29500-1:2016] section 18.8.31), with the following modification: The calendar type
is stored in byte 0 (the least significant byte) and the numeral system is stored in byte 1 (the most significant byte).

2.6.55 CT_ProtectedRanges

Referenced by: protectedRanges

A complex type that specifies a group of protected ranges on the sheet. MUST contain fewer than $2^{31}$ elements.

Child Elements:

protectedRange: A CT_ProtectedRange element that specifies the properties for a single protected range.

The following W3C XML Schema ([XMLSCHEMA1] section 2.1) fragment specifies the contents of this complex type.

See section 5.4 for the full W3C XML Schema ([XMLSCHEMA1] section 2.1).

2.6.56 CT_ProtectedRange

Referenced by: CT_ProtectedRanges

A complex type that specifies a cell range to be unprotected. The cell range is editable with a password or proper credentials when sheet protection is on and the cell is locked.

Child Elements:

xm:sqref: A sqref element that specifies the cell range to be unprotected.

Attributes:
password: An ST_UnsignedShortHex ([ISO/IEC29500-4:2016] section 15.7.2) attribute that specifies the verifier value of the password required for editing the cell range. If the value is 0x0000, then there is no password.

The verifier value is calculated in two stages. First, the provided Unicode password string is converted to a new character string in the ANSI code page of the current system by using the algorithm specified in the revisionsPassword attribute in [ISO/IEC29500-1:2016] section 18.2.29. Second, this string is input into the XOR obfuscation algorithm specified in [MS-OFFCRYPTO] section 2.3.7.1 to produce a 16-bit password verifier value.

This attribute MUST NOT be present if algorithmName is present.

algorithmName: An ST_Xstring ([ISO/IEC29500-1:2016] section 22.9.2.19) attribute that specifies the name of the hash algorithm used to calculate hashValue. If this attribute is present, hashValue, saltValue, and spinCount MUST also be present. This attribute MUST NOT be present if password is present.

hashValue: A base64Binary ([XMLSCHEMA2] section 3.2.16) attribute that specifies the hash value for the password required to edit this range. This value will be compared with the resulting hash value after hashing the user-supplied password by using the algorithm specified by algorithmName, and if the two values match, the protection will no longer be enforced.

Password hashes are computed by the algorithm specified in [MS-OFFCRYPTO] section 2.4.2.4. Under some circumstances, the password is first converted to a 16-bit verifier value and reinterpreted as a single Unicode character, which is then passed to the algorithm specified in [MS-OFFCRYPTO] section 2.4.2.4. There is no way to determine which method was used to generate a hash without knowledge of the password; it is necessary to compute both hashes to verify the password.

This attribute MUST be present if and only if algorithmName is present.

saltValue: A base64Binary ([XMLSCHEMA2] section 3.2.16) attribute that specifies the salt used to calculate hashValue. This attribute MUST be present if and only if algorithmName is present.

spinCount: An unsignedInt ([XMLSCHEMA2] section 3.3.22) attribute that specifies the number of times that the hash function was iterated over the password to generate the hashValue. It MUST NOT be greater than 10,000,000. This attribute MUST be present if and only if algorithmName is present.

name: An ST_Xstring ([ISO/IEC29500-1:2016] section 22.9.2.19) attribute that specifies the title of the cell range. The value MUST be unique for the sheet. The number of characters in the string MUST be greater than or equal to 1, and less than or equal to 255. The string MUST conform to the following Augmented Backus-Naur Form (ABNF) ([RFC5234]) grammar:

```
string =  name-start-character *name-character

name-start-character = "_" / "\" / Unicode-character

name-character = name-start-character / Unicode-space / Unicode-digit / "?" / "."
```

The following points summarize this grammar:

- Unicode-character is any code point that is a character as defined by the Unicode character properties, [UNICODE5.1] chapter 4.
- Unicode-digit is any code point that is a digit as defined by the Unicode character properties, [UNICODE5.1] chapter 4.
- Unicode-space is any code point that is a space as defined by the Unicode character properties, [UNICODE5.1] chapter 4.
securityDescriptor: A string ([XMLSCHEMA2] section 3.2.1) attribute that describes a security descriptor ([MS-AZOD] section 1.1.1.3) that lists users who can edit the cell range without providing the password.

The following W3C XML Schema ([XMLSCHEMA1] section 2.1) fragment specifies the contents of this complex type.

2.6.162  **CT_DynamicRichFilter**

*Target namespace:* http://schemas.microsoft.com/office/spreadsheetml/2017/richdata2

*Referenced by:*  **CT_RichFilterColumn**

This complex type specifies the dynamic filter criteria associated with rich values. These criteria are considered dynamic because they can change, either with the data itself (e.g., "above average") or with the current system date (e.g., show values for "today"). For any cells within the filter range whose values do not meet the specified criteria, the corresponding rows will be hidden from view when the filter is applied.

*Attributes:*

- **key:** An ST_RichFilterKey (section 2.7.38) attribute that specifies the rich value key for which the filters is defined.

- **type:** An ST_DynamicFilterType ([ISO/IEC29500-1:2016] section 18.18.26) attribute that specifies the type of dynamic filter.

- **val:** A double ([XMLSCHEMA2] section 3.2.5) attribute that specifies a minimum value for dynamic filter. It is inclusive for today, yesterday, tomorrow, nextWeek, thisWeek, lastWeek, nextMonth, thisMonth, lastMonth, nextQuarter, thisQuarter, lastQuarter, nextYear, thisYear, lastYear, and yearToDate. The **val** attribute is not required for Q1, Q2, Q3, Q4, M1, M2, M3, M4, M5, M6, M7, M8, M9, M10, M11 and M12. It is exclusive for aboveAverage and belowAverage.

- **maxVal:** A double ([XMLSCHEMA2] section 3.2.5) attribute that specifies a maximum value for dynamic filter. It is exclusive and required for today, yesterday, tomorrow, nextWeek, thisWeek, lastWeek, nextMonth, thisMonth, lastMonth, nextQuarter, thisQuarter, lastQuarter, nextYear, thisYear, lastYear, and yearToDate.

- **valIso:** A dateTime ([XMLSCHEMA2] section 3.2.7) attribute that specifies a minimum value for dynamic filter. (See description of the **maxValIso** attribute to understand when the **valIso** attribute is required.)

- **maxValIso:** A dateTime ([XMLSCHEMA2] section 3.2.7) attribute that specifies a maximum value for dynamic filter. The **maxValIso** attribute is required for today, yesterday, tomorrow, nextWeek, thisWeek, lastWeek, nextMonth, thisMonth, lastMonth, nextQuarter, thisQuarter, lastQuarter, nextYear, thisYear, lastYear, and yearToDate.

The above criteria are based on a value range; that is, if today's date is September 22nd, then the range for thisWeek is the values greater than or equal to September 17 and less than September 24. In the thisWeek range, the lower value is expressed valIso. The higher value is expressed using the **maxValIso** attribute.

These dynamic filters do not require the **valIso** or **maxValIso** attributes:

Q1, Q2, Q3, Q4, M1, M2, M3, M4, M5, M6, M7, M8, M9, M10, M11 and M12.

The above criteria shall not specify the range using **valIso** and **maxValIso** because Q1 always starts from M1 to M3, and M1 is always January.

These types of dynamic filters use **valIso** and do not use **maxValIso**:

aboveAverage and belowAverage

3 Structure Examples

This section contains examples of some of the most commonly used data structures in Excel Binary File Format files. The examples are meant to be a starting point for an implementer learning the file format. They are not meant to cover all records in the file format.

In the following sections, the schema definition might differ from the processing rules imposed by the application. The XSD in this specification provides a base description of the file format. The text that introduces the XSD specifies additional restrictions that reflect actual Microsoft product behavior. For example, the schema definition might allow for an element to be empty, null, or not present but the behavior of the application as specified restricts the same elements to being non-empty, not null, and present.

3.1 Slicer

This example shows a slicer attached to a native PivotTable and its associated slicer cache. The PivotTable has the "State" and "City" fields added to the row area and the "Population" field added to the data area. The slicer is based on the "State" field, and is currently filtering on "Washington".

The following figure shows a possible implementation of the slicer discussed in this example.

![Figure 1: PivotTable and slicer](image)

The following figure shows that the source data for the PivotTable that the slicer discussed in this example is filtering, as depicted on a possible implementation of a worksheet.
This example includes the entire slicer cache and slicer parts that are used in the specification of a non-OLAP slicer.

The <i> elements inside the <items> element specify the cached non-OLAP slicer items. "Washington" and "Oregon" are the cached non-OLAP slicer items in this example.

### 3.1.1 Slicer Cache Part

The following is an example slicer cache part, as specified in section 2.1.4.

```xml

4 Security Considerations

4.1 Security Considerations for Implementers

The password verifier features available in the file format are used to prevent accidental modification, rather than being used as security features. It is possible to remove the passwords by removing the records containing the verifier values.

The translation of passwords from a double-byte Unicode string to a new character string in the ANSI code page of the current system converts any Unicode character that cannot be mapped to the ANSI code page of the current system to the 0x3F character in that code page, as described in [ISO/IEC29500-1:2016] section 18.2.29. Replacing these characters with "0x3F" when the hash is verified will generate positive hash value matches. In certain locales, this can be a significant portion of the everyday character set.

Further security considerations regarding the file encryption algorithms are described in [MS-OFFCRYPTO] section 4.3.

4.2 Index of Security Fields

None.
5 Appendix A: Full XML Schema

For ease of implementation, this section provides the full W3C XML schemas for the new elements, attributes, complex types, and simple types specified in the earlier sections. Any schema references to namespaces included in Office Open XML file formats as described in [ISO/IEC29500-1:2016] refer specifically to the transitional schemas as described in [ISO/IEC29500-4:2016].

For ease of implementation, the following sections provide the full XML schema for this protocol.

6 Appendix B: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include updates to those products.

- Microsoft Office Excel 2007
- Microsoft Excel 2010
- Microsoft Excel 2013
- Microsoft Excel 2016
- Microsoft Excel 2019 Preview

Exceptions, if any, are noted in this section. If an update version, service pack or Knowledge Base (KB) number appears with a product name, the behavior changed in that update. The new behavior also applies to subsequent updates unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms "SHOULD" or "SHOULD NOT" implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term "MAY" implies that the product does not follow the prescription.

<4> Section 2.2: This namespace was introduced in Excel 2013.
<5> Section 2.2: This namespace was introduced in Excel 2013.
<6> Section 2.5.4: This attribute is available only in Excel 2016.
<7> Section 2.6.3: Office Excel 2007, Excel 2010, and Excel 2013 do not always write the correct value into this field. Although the value of this field is validated on load, it is not used at run time.
<8> Section 2.6.3: Office Excel 2007, Excel 2010, and Excel 2013 do not always write the correct value into this field. Although the value of this field is validated on load, it is not used at run time.
<9> Section 2.6.10: The following table shows the different versions of function accuracy that Excel 2010 and Excel 2013 supports.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Functions are calculated using the current application’s algorithms.</td>
</tr>
<tr>
<td>1</td>
<td>Functions are calculated using algorithms implemented in Office Excel 2007.</td>
</tr>
<tr>
<td>2</td>
<td>Functions are calculated using algorithms implemented in Excel 2010.</td>
</tr>
</tbody>
</table>

<10> Section 2.6.24: Office Excel 2007 does not support multiple uses of the same OLAP measure in one cache hierarchy, and does not discard the associated cache hierarchy when ignore is TRUE.

<12> Section 2.6.30: Office Excel 2007 does not ignore these complex types.
**Section 2.6.31**: Office Excel 2007 does not support multiple uses of the same OLAP measure in one PivotTable view, and does not ignore this pivot field when `ignore` is TRUE.

**Section 2.6.34**: The 2007 Microsoft Office system does not load a file in which this field contains a value that it does not recognize, or is not recognized by the underlying operating system. The 2007 Office system recognizes the following language tags:
